# High-resolution MPAS ensemble forecasts

- Deterministic high-resolution forecasts not accurate after a few hours
  - Need ensembles!
- Can high-res global ensembles provide **skillful** and **reliable** 3–5-day forecasts of severe weather and precipitation?

# Three ensemble sets

1. Quasi-uniform  
MPAS 15-km mesh
2. Variable resolution  
MPAS 15-/3-km mesh
3. NCEP GEFS forecasts  
(~34-km grid spacing)

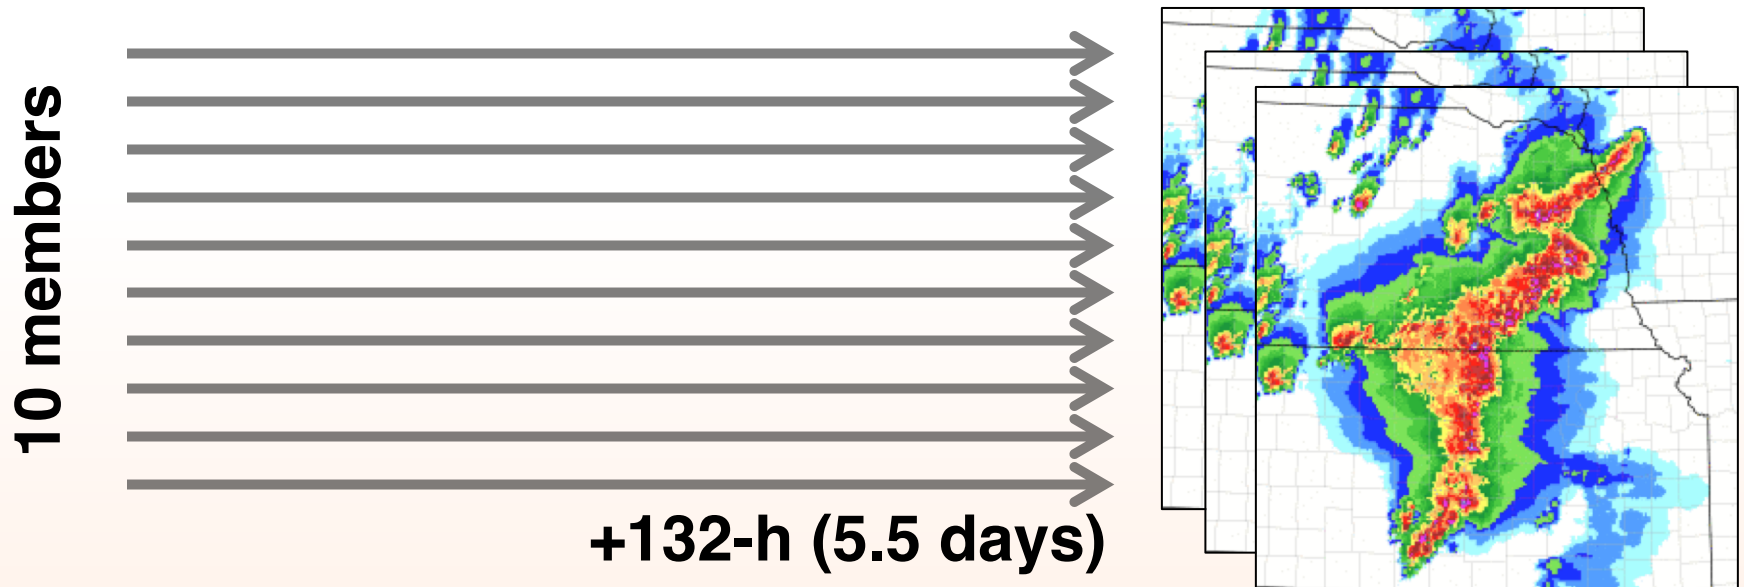

**10-member  
ensemble forecasts**

**Variable resolution 15-/3-km mesh**

# Ensemble forecasts

**35 forecasts (23 April 2017 – 27 May 2017)**

**Initialization: 00 UTC from GEFS analyses**

**MPAS single-physics ensembles using WRFV3.9 versions of  
MYNN / Thompson / RRTMG / Grell-Freitas scale-aware**

# Forecast verification

- 3-h probabilistic precipitation forecasts
  - Verification region: CONUS east of the Rockies
  - NCEP Stage IV observations as “truth”
  - Forecast data interpolated to Stage IV grid
- Surrogate severe weather (3-km MPAS only)
  - Based on 2-5-km updraft helicity
  - Verified against SPC storm reports
- All statistics aggregated over 35 forecasts
  - Statistics computed with bias-corrected forecasts

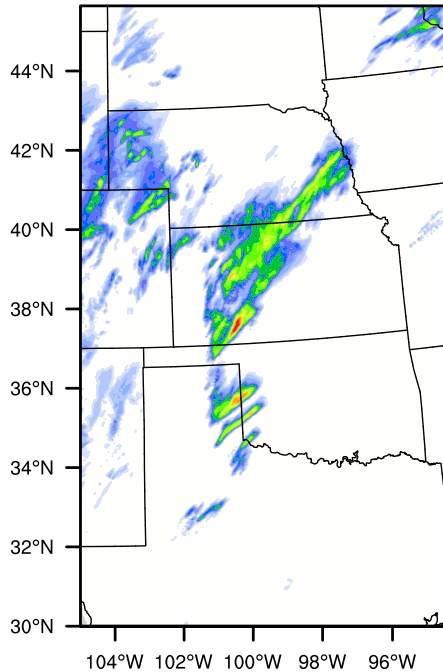

# Probabilistic event definition

- “Probability of an event occurring *within*  $x$  km of a point”
  - “Neighborhood maximum ensemble probability” (NMEP; Schwartz and Sobash 2017)
  - Consistent with SPC convective outlooks
  - Arguably, verifying probability of event occurrence *within* a distance of a point is more appropriate than verifying probability of event occurrence *at* a point for medium-range predictions

# Surrogate severe verification

- MPAS severe weather Brier Skill Score (BSS) for Days 1-5

# Summary and future work

- 3-km MPAS ensemble forecasts appear to have probabilistic skill through 5.5 days
  - Reliability not great
- Better forecasts by data assimilation on variable-resolution 15-/3-km grid?
- Compare global ensembles to MPAS regional ensemble runs
  - Lateral boundary condition impact on spread?

# Verification method

- Pick an event
- The event has occurred in the shaded boxes
- If, at a point, an **event occurs anywhere within the neighborhood**, give the point a value of 1

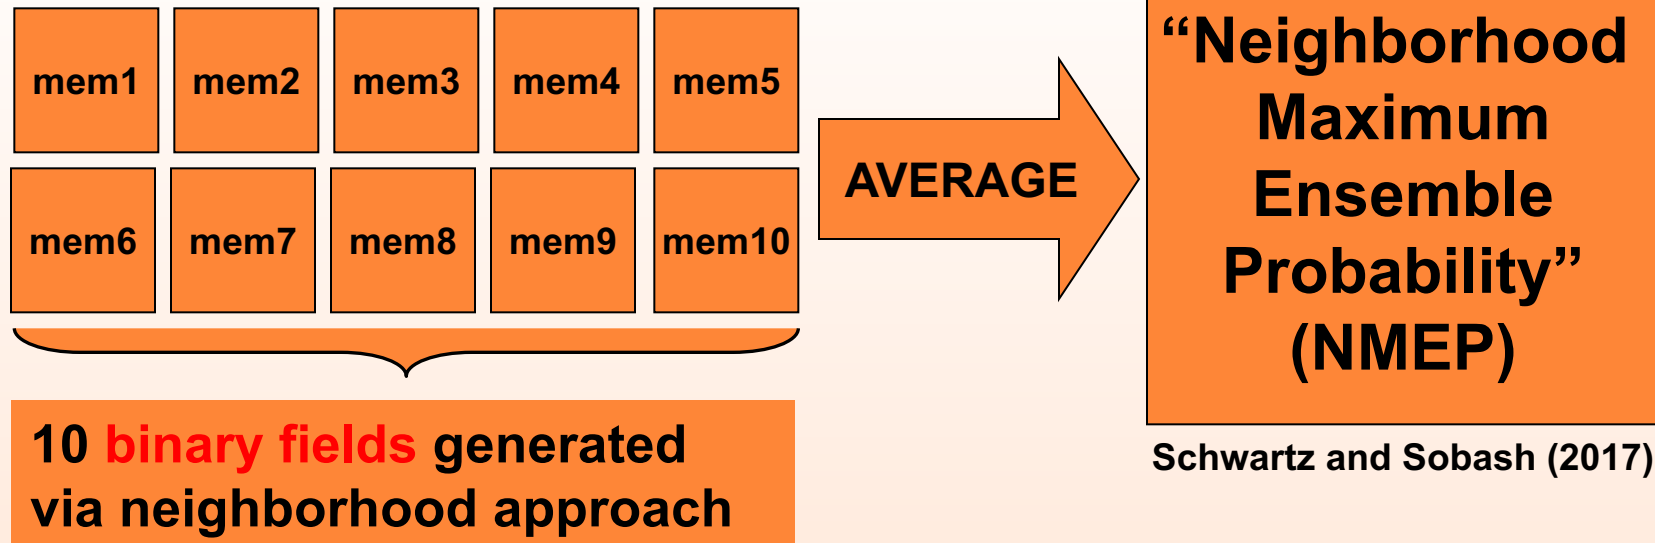

Hypothetical model output

**P = 100%**

# NMEP method

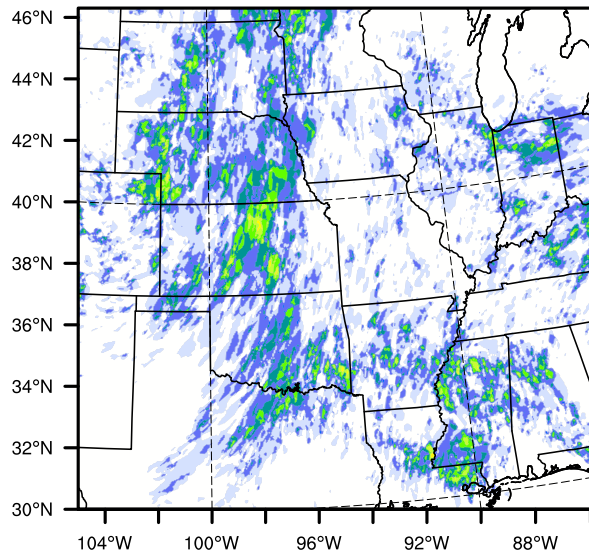

- If, at a point, an **event occurs anywhere within the neighborhood**, give the point a value of 1, otherwise 0
  - Do this for all ensemble members individually
  - Average across the ensemble at each point to get a probability **between 0 and 1**

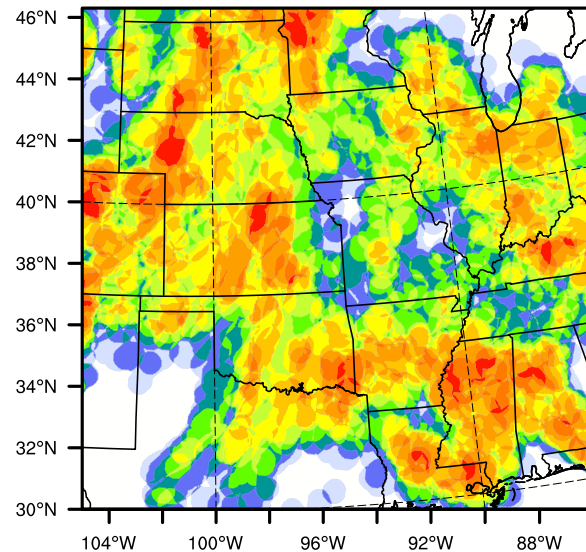

# NMEPs for a 10-member ensemble

- NMEPs of 1-h precipitation  $\geq 1.0$  mm/h
  - $x$ : neighborhood length scale (radius of a circle)

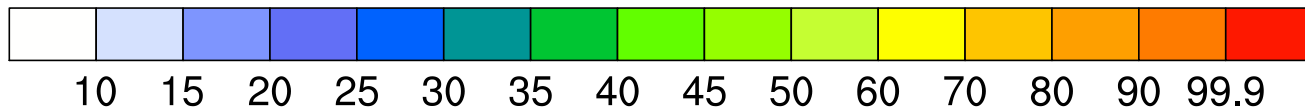

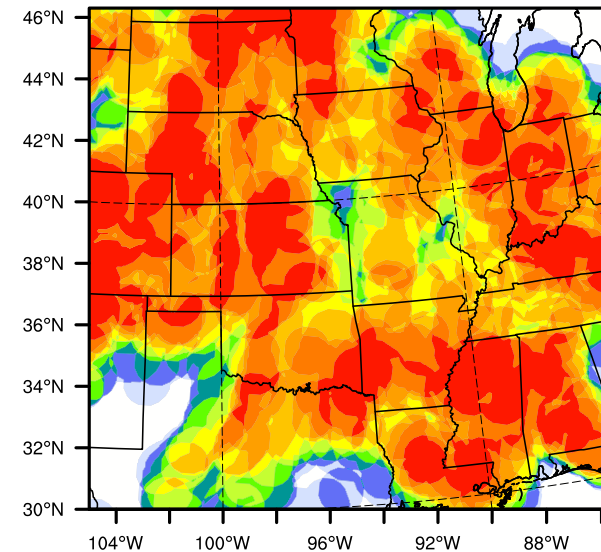

$x = 0$  km (grid scale)

$x = 50$  km

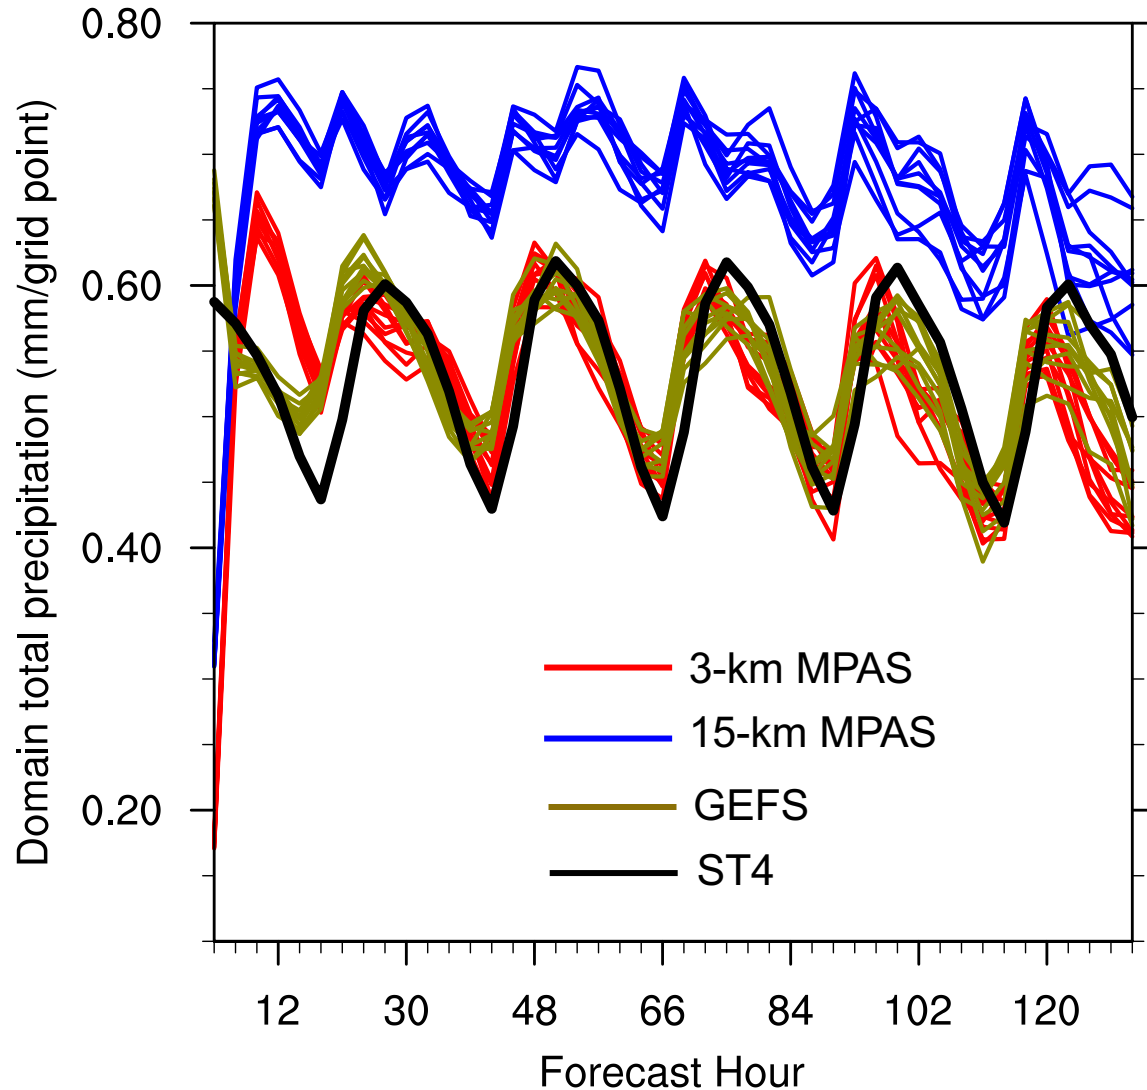

$x = 100$  km

Probability (%)

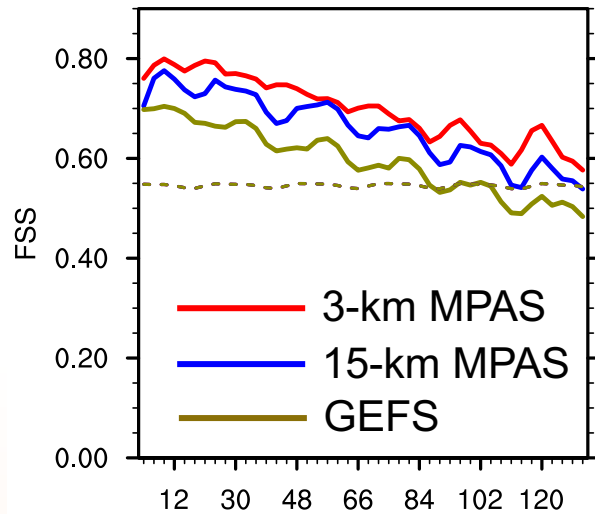

# Total precipitation

- Domain total precipitation (normalized by number of grid points)
- Aggregated over 35 forecasts
