WRF ARW Tech Note

A Description of the Advanced Research WRF Version 3

<http://www.mmm.ucar.edu/wrf/users/pub-doc.html>

ARW Dynamical Solver

- Terrain representation
- Vertical coordinate
- Equations / variables
- Time integration scheme
- Grid staggering
- Advection scheme
- Time step parameters
- Filters
- Boundary conditions
- Nesting
- Map projections

ARW, Terrain Representation

Lower boundary condition for the geopotential ($\phi = gz$) specifies the terrain elevation, and specifying the lowest coordinate surface to be the terrain results in a terrain-following coordinate.

$$\frac{\partial \phi}{\partial t} + u \frac{\partial \phi}{\partial x} + v \frac{\partial \phi}{\partial y} + \omega \frac{\partial \phi}{\partial \eta} = g\omega$$

Vertical coordinate:

$$\text{hydrostatic pressure } \pi \quad \eta = \frac{(\pi - \pi_t)}{\mu}, \quad \mu = \pi_s - \pi_t$$

Flux-Form Equations in ARW

Hydrostatic pressure coordinate:

hydrostatic pressure π

$$\eta = \frac{(\pi - \pi_t)}{\mu}, \quad \mu = \pi_s - \pi_t \quad \mu(x) \Delta \eta = \Delta \pi = -g \rho \Delta z$$

Conserved state variables:

$$\mu, \quad U = \mu u, \quad V = \mu v, \quad W = \mu w, \quad \Theta = \mu \theta$$

Non-conserved state variable: $\phi = gz$

Flux-Form Equations in ARW

Inviscid, 2-D
equations
without rotation:

$$\frac{\partial U}{\partial t} + \mu \alpha \frac{\partial p}{\partial x} + \frac{\partial p}{\partial \eta} \frac{\partial \phi}{\partial x} = - \frac{\partial U u}{\partial x} - \frac{\partial \Omega u}{\partial \eta}$$

$$\frac{\partial W}{\partial t} + g \left(\mu - \frac{\partial p}{\partial \eta} \right) = - \frac{\partial U w}{\partial x} - \frac{\partial \Omega w}{\partial \eta}$$

$$\frac{\partial \Theta}{\partial t} + \frac{\partial U \theta}{\partial x} + \frac{\partial \Omega \theta}{\partial \eta} = \mu Q$$

$$\frac{\partial \mu}{\partial t} + \frac{\partial U}{\partial x} + \frac{\partial \Omega}{\partial \eta} = 0$$

$$\frac{d\phi}{dt} = g w$$

Diagnostic
relations:

$$\frac{\partial \phi}{\partial \eta} = -\mu \alpha, \quad p = \left(\frac{R \theta}{p_0 \alpha} \right)^\gamma, \quad \Omega = \mu \dot{\eta}$$

Moist Equations in ARW

Moist Equations:

$$\frac{\partial U}{\partial t} + \alpha \mu_d \frac{\partial p}{\partial x} + \frac{\alpha}{\alpha_d} \frac{\partial p}{\partial \eta} \frac{\partial \phi}{\partial x} = - \frac{\partial U u}{\partial x} - \frac{\partial \Omega u}{\partial \eta}$$

$$\frac{\partial W}{\partial t} + g \left(\mu_d - \frac{\alpha}{\alpha_d} \frac{\partial p}{\partial \eta} \right) = - \frac{\partial U w}{\partial x} - \frac{\partial \Omega w}{\partial \eta}$$

$$\frac{\partial \mu_d}{\partial t} + \frac{\partial U}{\partial x} + \frac{\partial \Omega}{\partial \eta} = 0$$

$$\frac{\partial (\mu_d q_{v,l})}{\partial t} + \frac{\partial (U q_{v,l})}{\partial x} + \frac{\partial (\Omega q_{v,l})}{\partial \eta} = \mu Q_{v,l}$$

Diagnostic relations:

$$\frac{\partial \phi}{\partial \eta} = -\alpha_d \mu_d, \quad p = \left(\frac{R\Theta}{p_o \mu_d \alpha_v} \right)^\gamma$$

Time Integration in ARW

3rd Order Runge-Kutta time integration

advance $\phi^t \rightarrow \phi^{t+\Delta t}$

$$\phi^* = \phi^t + \frac{\Delta t}{3} R(\phi^t)$$

$$\phi^{**} = \phi^t + \frac{\Delta t}{2} R(\phi^*)$$

$$\phi^{t+\Delta t} = \phi^t + \Delta t R(\phi^{**})$$

Amplification factor $\phi_t = i k \phi$; $\phi^{n+1} = A \phi^n$; $|A| = 1 - \frac{(k\Delta t)^4}{24}$

Phase and amplitude errors for LF, RK3

Oscillation
equation
analysis

$$\phi_t = ik\phi$$

Time-Split Runge-Kutta Integration Scheme

$$U_t = L_{\text{fast}}(U) + L_{\text{slow}}(U)$$

3rd order Runge-Kutta, 3 steps

- RK3 is 3rd order accurate for linear eqns, 2nd order accurate for nonlinear eqns.
- Stable for centered and upwind advection schemes.
- Stable for Courant number $Udt/dx < 1.73$
- Three $L_{\text{slow}}(U)$ evaluations per timestep.

WRF ARW Model Integration Procedure

Begin time step

End time step

Flux-Form Perturbation Equations

Introduce the
perturbation variables:

$$\begin{aligned}\phi &= \bar{\phi}(z) + \phi', \mu = \bar{\mu} + \mu'; \\ p &= \bar{p}(z) + p', \alpha = \bar{\alpha}(z) + \alpha'\end{aligned}$$

Note – $\phi = \bar{\phi}(z) = \bar{\phi}(x, y, \eta)$,
likewise $\bar{p}(x, y, \eta), \bar{\alpha}(x, y, \eta)$

Momentum and hydrostatic equations become:

$$\begin{aligned}\frac{\partial U}{\partial t} + \mu\alpha \frac{\partial p'}{\partial x} + \eta\mu\alpha' \frac{\partial \bar{\mu}}{\partial x} + \mu \frac{\partial \phi'}{\partial x} + \frac{\partial \phi'}{\partial x} \left(\frac{\partial p'}{\partial \eta} - \mu' \right) &= - \frac{\partial Uu}{\partial x} - \frac{\partial \Omega u}{\partial \eta} \\ \frac{\partial W}{\partial t} + g \left(\mu' - \frac{\partial p'}{\partial \eta} \right) &= - \frac{\partial U_w}{\partial x} - \frac{\partial \Omega_w}{\partial \eta} \\ \frac{\partial \phi'}{\partial \eta} &= -\bar{\mu}\alpha' - \bar{\alpha}\mu'\end{aligned}$$

Flux-Form Perturbation Equations: Acoustic Step

Acoustic mode separation:

Recast Equations in terms of perturbation about time t

$$U' = U'^t + U'', \quad V' = V'^t + V'', \quad W' = W'^t + W'',$$

$$\Theta' = \Theta'^t + \Theta'', \quad \mu' = \mu'^t + \mu'', \quad \phi' = \phi'^t + \phi'';$$

$$p' = p'^t + p'', \quad \alpha' = \alpha'^t + \alpha''$$

Linearize ideal gas law
about time t

$$p'' = \frac{c_s^2}{\alpha^t} \left(\frac{\Theta''}{\Theta^t} - \frac{\alpha''}{\alpha^t} - \frac{\mu''}{\mu^t} \right)$$

$$\alpha'' = \frac{1}{\mu^t} \left(\frac{\partial \phi''}{\partial \eta} + \alpha^t \mu'' \right)$$

Vertical pressure gradient
becomes

$$\frac{\partial p''}{\partial \eta} = \frac{\partial}{\partial \eta} \left(\frac{c_s^2}{\mu^t \alpha^{t^2}} \frac{\partial \phi''}{\partial \eta} + \frac{c_s^2}{\mu^t} \frac{\Theta''}{\Theta^t} \right)$$

Acoustic Integration in ARW

Forward-backward scheme, first advance the horizontal momentum

$$\delta_\tau U'' + \mu^t \alpha^t \frac{\partial p''}{\partial x} + \eta \mu^t \frac{\partial \bar{\mu}}{\partial x} \alpha'' + \mu^t \frac{\partial \phi''}{\partial x} + \frac{\partial \phi^t}{\partial x} \left(\frac{\partial p''}{\partial \eta} - \mu'' \right) = R_u^t$$

Second, advance continuity equation,

$$\delta_\tau \mu'' + (\nabla \cdot \mathbf{V}'')_{\eta}^{\tau+\Delta\tau} = R_\mu^t$$

diagnose omega,

and advance thermodynamic equation

$$\delta_\tau \Theta'' + (\nabla \cdot \mathbf{V}'' \theta^t)_{\eta}^{\tau+\Delta\tau} = R_\Theta^t$$

Finally, vertically-implicit integration of the acoustic and gravity wave terms

$$\delta_\tau W'' + g \left[\overline{\mu'' - \frac{\partial}{\partial \eta} \left(\frac{c_s^2}{\mu^t \alpha^{t^2}} \frac{\partial \phi''}{\partial \eta} + \frac{c_s^2}{\alpha^t} \frac{\Theta''}{\Theta^t} \right)} \right]^\tau = R_w^t$$

$$\delta_\tau \phi'' + \frac{1}{\mu^t} \left[(\mathbf{V}'' \cdot \nabla \phi^t)_{\eta}^{\tau+\Delta\tau} - g \overline{W''}^\tau \right] = R_\phi^t$$

Hydrostatic Option

Instead of solving vertically implicit equations for W'' and ϕ''

Integrate the hydrostatic equation to obtain $p''^{\tau+\Delta\tau}$:

$$\frac{\partial p''}{\partial \eta} = \left(\frac{\alpha_d}{\alpha} \right)^t \mu_d''$$

Solve the linearized
ideal gas law for $\alpha_d''^{\tau+\Delta\tau}$:

$$p'' = \frac{c_s^2}{\alpha^t} \left(\frac{\Theta''}{\Theta^t} - \frac{\alpha_d''}{\alpha_d^t} - \frac{\mu_d''}{\mu_d^t} \right)$$

and recover $\phi''^{\tau+\Delta\tau}$ from:

$$\alpha_d'' = \frac{1}{\mu_d^t} \left(\frac{\partial \phi''}{\partial \eta} + \alpha_d^t \mu_d'' \right)$$

W'' is no longer required during the integration.

ARW model, grid staggering

C-grid staggering

horizontal

vertical

Advection in the ARW Model

2nd, 3rd, 4th, 5th and 6th order centered and upwind-biased schemes are available in the ARW model.

Example: 5th order scheme

$$\frac{\partial(U\phi)}{\partial x} = \frac{1}{\Delta x} \left(F_{i+\frac{1}{2}}(U\phi) - F_{i-\frac{1}{2}}(U\phi) \right)$$

where

$$F_{i-\frac{1}{2}}(U\phi) = U_{i-\frac{1}{2}} \left\{ \frac{37}{60} (\phi_i + \phi_{i-1}) - \frac{2}{15} (\phi_{i+1} + \phi_{i-2}) + \frac{1}{60} (\phi_{i+2} + \phi_{i-3}) \right\} \\ - \text{sign}(1, U) \frac{1}{60} \{ (\phi_{i+2} - \phi_{i-3}) - 5(\phi_{i+1} - \phi_{i-2}) + 10(\phi_i - \phi_{i-1}) \}$$

Advection in the ARW Model

For constant U, the 5th order flux divergence tendency becomes

$$\begin{aligned} \Delta t \frac{\delta(U\phi)}{\Delta x} \Big|_{5th} &= \Delta t \frac{\delta(U\phi)}{\Delta x} \Big|_{6th} \\ &\quad - \underbrace{\left| \frac{U\Delta t}{\Delta x} \right| \frac{1}{60} (-\phi_{i-3} + 6\phi_{i-2} - 15\phi_{i-1} + 20\phi_i - 15\phi_{i+1} + 6\phi_{i+2} - \phi_{i+3})}_{\frac{Cr}{60} \frac{\partial^6 \phi}{\partial x^6} + H.O.T} \end{aligned}$$

The odd-ordered flux divergence schemes are equivalent to the next higher ordered (even) flux-divergence scheme plus a dissipation term of the higher even order with a coefficient proportional to the Courant number.

Mass Conservation in the ARW Model

Mass in a control volume is proportional to

$$(\Delta x \Delta \eta) (\mu)^t$$

since $\mu(x) \Delta \eta = \Delta \pi = -g \rho \Delta z$

Mass Conservation in the ARW Model

Mass in a control volume $(\Delta x \Delta \eta)(\mu)^t$
2D example

Mass conservation equation

$$\Delta t^{-1}(\Delta x \Delta \eta) \cdot [(\mu)^{t+\Delta t} - (\mu)^t] = [(\mu u \Delta \eta)_{x-\Delta x/2, \eta} - (\mu u \Delta \eta)_{x+\Delta x/2, \eta}] + [(\mu \omega \Delta x)_{x, \eta-\Delta \eta/2} - (\mu \omega \Delta x)_{x, \eta+\Delta \eta/2}]$$

Change in mass over a time step

mass fluxes through
control volume faces

Mass Conservation in the ARW Model

Mass in a control volume $(\Delta x \Delta \eta)(\mu)^t$

Mass conservation equation

$$\Delta t^{-1}(\Delta x \Delta \eta) \cdot [(\mu)^{t+\Delta t} - (\mu)^t] = [(\mu u \Delta \eta)_{x-\Delta x/2, \eta} - (\mu u \Delta \eta)_{x+\Delta x/2, \eta}] + [(\mu \omega \Delta x)_{x, \eta-\Delta \eta/2} - (\mu \omega \Delta x)_{x, \eta+\Delta \eta/2}]$$

Horizontal fluxes through the vertical control-volume faces

Mass Conservation in the ARW Model

Mass in a control volume $(\Delta x \Delta \eta)(\mu)^t$

Mass conservation equation

$$\Delta t^{-1}(\Delta x \Delta \eta) \cdot [(\mu)^{t+\Delta t} - (\mu)^t] = [(\mu u \Delta \eta)_{x-\Delta x/2, \eta} - (\mu u \Delta \eta)_{x+\Delta x/2, \eta}] + [(\mu \omega \Delta x)_{x, \eta-\Delta \eta/2} - (\mu \omega \Delta x)_{x, \eta+\Delta \eta/2}]$$

Vertical fluxes through the horizontal control-volume faces

Mass Conservation in the ARW Model

The same mass fluxes are used for neighboring grid cells - hence mass is conserved locally and globally.

Scalar Mass Conservation in the ARW Model

Mass in a control volume $(\Delta x \Delta \eta)(\mu)^t$

Scalar mass $(\Delta x \Delta \eta)(\mu \phi)^t$

Mass conservation equation:

$$\Delta t^{-1}(\Delta x \Delta \eta) \cdot [(\mu)^{t+\Delta t} - (\mu)^t] = [(\mu u \Delta \eta)_{x-\Delta x/2, \eta} - (\mu u \Delta \eta)_{x+\Delta x/2, \eta}] + [(\mu \omega \Delta x)_{x, \eta-\Delta \eta/2} - (\mu \omega \Delta x)_{x, \eta+\Delta \eta/2}]$$

↑
change in mass over a time step
mass fluxes through control volume faces

Scalar mass conservation equation:

$$\Delta t^{-1}(\Delta x \Delta \eta) \cdot [(\mu \phi)^{t+\Delta t} - (\mu \phi)^t] = [(\mu u \phi \Delta \eta)_{x-\Delta x/2, \eta} - (\mu u \phi \Delta \eta)_{x+\Delta x/2, \eta}] + [(\mu \omega \phi \Delta x)_{x, \eta-\Delta \eta/2} - (\mu \omega \phi \Delta x)_{x, \eta+\Delta \eta/2}]$$

↑
change in tracer mass over a time step
tracer mass fluxes through control volume faces

Moisture Transport in ARW

1D advection

ARW scheme is conservative,
but not positive definite nor monotonic.
Removal of negative q ■
results in spurious source of q ■ .

Positive-Definite Flux Renormalization

Scalar update, last RK3 step

$$(\mu\phi)^{t+\Delta t} = (\mu\phi)^t - \Delta t \sum_{i=1}^n \delta_{x_i} [f_i] \quad (1)$$

- (1) Decompose flux: $f_i = f_i^{upwind} + f_i^c$
- (2) Renormalize high-order correction fluxes f_i^c such that solution is positive definite: $f_i^c = R(f_i^c)$
- (3) Update scalar eqn. (1) using $f_i = f_i^{upwind} + R(f_i^c)$

Skamarock, MWR 2006, 2241-2250

PD Limiter in ARW - 1D Example

Top-Hat Advection

$Cr = 0.5$, 1 revolution (200 steps)

ARW Model: Dynamics Parameters

3rd order Runge-Kutta time step

Courant number limited, 1D: $C_r = \frac{U\Delta t}{\Delta x} < 1.73$

Generally stable using a timestep approximately twice as large as used in a leapfrog model.

Acoustic time step

2D horizontal Courant number limited: $C_r = \frac{C_s \Delta \tau}{\Delta h} < \frac{1}{\sqrt{2}}$

$\Delta \tau_{sound} = \Delta t_{RK} / (\text{number of acoustic steps})$

Guidelines for time step

Δt in seconds should be about $6 * \Delta x$ (grid size in kilometers). Larger Δt can be used in smaller-scale dry situations, but *time_step_sound* (default = 4) should increase proportionately if larger Δt is used.

Maximum Courant Number for Advection

$$C_a = U \Delta t / \Delta x$$

<i>Time Integration Scheme</i>	<i>Advection Scheme</i>				
	<i>2nd</i>	<i>3rd</i>	<i>4th</i>	<i>5th</i>	<i>6th</i>
Leapfrog ($\alpha=0.1$)	0.91	U	0.66	U	0.57
RK2	U	0.90	U	0.39	U
RK3	1.73	1.63	1.26	1.43	1.09

U = unstable

(Wicker & Skamarock, 2002)

ARW Filters: Divergence Damping

Purpose: filter acoustic modes

$$p^{*\tau} = p^\tau + \gamma_d (p^\tau - p^{\tau - \Delta\tau}) \quad \text{since} \quad p_t \sim c^2 \nabla \cdot \rho \mathbf{V}$$

$$\begin{aligned} \delta_\tau U'' + \mu^{t*} \alpha^{t*} \partial_x p''^\tau + (\mu^{t*} \partial_x \bar{p}) \alpha''^\tau \\ + (\alpha/\alpha_d) [\mu^{t*} \partial_x \phi''^\tau + (\partial_x \phi^{t*}) (\partial_\eta p'' - \mu'')^\tau] = R_U^{t*} \end{aligned}$$

$$\begin{aligned} \delta_\tau V'' + \mu^{t*} \alpha^{t*} \partial_y p''^\tau + (\mu^{t*} \partial_y \bar{p}) \alpha''^\tau + \\ + (\alpha/\alpha_d) [\mu^{t*} \partial_y \phi''^\tau + (\partial_y \phi^{t*}) (\partial_\eta p'' - \mu'')^\tau] = R_V^{t*} \end{aligned}$$

$\gamma_d = 0.1$ recommended (default)

ARW Filters: External Mode Filter

Purpose: filter the external mode
(primarily for real-data applications)

Additional terms:

$$\delta_{\tau} U'' = \dots - \gamma_e (\Delta x^2 / \Delta \tau) \delta_x (\delta_{\tau - \Delta \tau} \mu_d'')$$

$$\delta_{\tau} V'' = \dots - \gamma_e (\Delta y^2 / \Delta \tau) \delta_y (\delta_{\tau - \Delta \tau} \mu_d'')$$

$$\delta_{\tau} \mu_d = m^2 \int_1^0 [\partial_x U'' + \partial_y V'']^{\tau + \Delta \tau} d\eta$$

$\gamma_e = 0.01$ recommended (default)

ARW Filters: Vertically Implicit Off-Centered Acoustic Step

Purpose: damp vertically-propagating acoustic modes

$$\delta_\tau W'' - m^{-1} g \left[(\alpha/\alpha_d)^{t^*} \partial_\eta (C \partial_\eta \phi'') + \partial_\eta \left(\frac{c_s^2}{\alpha^{t^*}} \frac{\Theta''}{\Theta^{t^*}} \right) - \mu_d'' \right]^\tau = R_W^{t^*}$$
$$\delta_\tau \phi'' + \frac{1}{\mu_d^{t^*}} [m \Omega^{\tau+\Delta\tau} \phi_\eta - \overline{g W''}^\tau] = R_\phi^{t^*}.$$

$$\bar{a}^\tau = \frac{1+\beta}{2} a^{\tau+\Delta\tau} + \frac{1-\beta}{2} a^\tau$$

$\beta = 0.1$ recommended (default)

ARW Filters: Vertical Velocity Damping

Purpose: damp anomalously-large vertical velocities
(usually associated with anomalous physics tendencies)

Additional term:

$$\partial_t W = \dots - \mu_d \operatorname{sign}(W) \gamma_w (Cr - Cr_\beta)$$

$$Cr = \left| \frac{\Omega dt}{\mu d\eta} \right|$$

$Cr_\beta = 1.0$ typical value (default)

$\gamma_w = 0.3 \text{ m/s}^2$ recommended (default)

ARW Filters: 2nd-Order Horizontal Mixing, Horizontal-Deformation-Based K_h

Purpose: mixing on horizontal coordinate surfaces
(real-data applications)

$$K_h = C_s^2 l^2 \left[0.25(D_{11} - D_{22})^2 + \overline{D_{12}^2}^{xy} \right]^{\frac{1}{2}}$$

where $l = (\Delta x \Delta y)^{1/2}$

$$D_{11} = 2 m^2 [\partial_x(m^{-1}u) - z_x \partial_z(m^{-1}u)]$$

$$D_{22} = 2 m^2 [\partial_y(m^{-1}v) - z_y \partial_z(m^{-1}v)]$$

$$D_{12} = m^2 [\partial_y(m^{-1}u) - z_y \partial_z(m^{-1}u) \\ + \partial_x(m^{-1}v) - z_x \partial_z(m^{-1}v)]$$

$C_s = 0.25$ (Smagorinsky coefficient, default value)

ARW Filters: Upper Level Gravity-Wave Absorbers

(1) Absorbing layer using spatial filtering

Horizontal and vertical 2nd order diffusion operators with eddy viscosities that increase with height.

$$K_{dh} = \frac{\Delta x^2}{\Delta t} \gamma_g \cos\left(\frac{\pi}{2} \frac{z_{top} - z}{z_d}\right)$$

$$K_{dv} = \frac{\Delta z^2}{\Delta t} \gamma_g \cos\left(\frac{\pi}{2} \frac{z_{top} - z}{z_d}\right)$$

z_d - depth of the damping layer

K_{dh} , K_{dv} - horizontal and vertical eddy viscosities

γ_g - dimensionless damping coefficient, typical value 0.003

Not recommended !

ARW Filters: Upper Level Gravity-Wave Absorbers

(2) Traditional Rayleigh Damping - idealized cases only!

$$\begin{aligned}\frac{\partial u}{\partial t} &= -\tau(z) (u - \bar{u}) \\ \frac{\partial v}{\partial t} &= -\tau(z) (v - \bar{v}) \\ \frac{\partial w}{\partial t} &= -\tau(z) w, \\ \frac{\partial \theta}{\partial t} &= -\tau(z) (\theta - \bar{\theta})\end{aligned}$$

$$\tau(z) = \begin{cases} \gamma_r \sin^2 \left[\frac{\pi}{2} \left(1 - \frac{z_{top} - z}{z_d} \right) \right] & \text{for } z \geq (z_{top} - z_d); \\ 0 & \text{otherwise,} \end{cases}$$

$\tau(z)$ - damping rate (t^{-1})
 z_d - depth of the damping layer
 γ_r - dimensionless damping coefficient

ARW Filters: Upper Level Gravity-Wave Absorbers

(3) Implicit Rayleigh W - damping (nonhydrostatic equations only!)

$$\tilde{W}''^{\tau+\Delta\tau} - W''^{\tau} - g\Delta\tau \frac{\alpha}{\alpha_d} \frac{\partial}{\partial\eta} \left(C \frac{\partial \overline{\phi}''^{\tau}}{\partial\eta} \right) = \Delta\tau R_W^* \quad (1)$$

$$W''^{\tau+\Delta\tau} - \tilde{W}''^{\tau+\Delta\tau} = -\tau(z)\Delta\tau W''^{\tau+\Delta\tau} \quad (2)$$

$$\phi''^{\tau+\Delta\tau} - \phi''^{\tau} - g\Delta\tau \frac{1}{\mu} \overline{W}''^{\tau} = \Delta\tau R_{\phi}^* \quad (3)$$

Vertically implicit solution procedure:

Eliminate $\phi''^{\tau+\Delta\tau}$ from (1) using (3), solve for $\tilde{W}''^{\tau+\Delta\tau}$.

Apply implicit Rayleigh damping - solve for $W''^{\tau+\Delta\tau}$ using (2).

Recover the geopotential using $W''^{\tau+\Delta\tau}$ in (3).

$$\tau(z) = \begin{cases} \gamma_r \sin^2 \left[\frac{\pi}{2} \left(1 - \frac{z_{top}-z}{z_d} \right) \right] & \text{for } z \geq (z_{top} - z_d); \\ 0 & \text{otherwise,} \end{cases} \quad \begin{array}{l} \tau(z) - \text{damping rate (t}^{-1}\text{)} \\ z_d - \text{depth of the damping layer} \\ \gamma_r - \text{dimensionless damping coefficient} \end{array}$$

Global WRF - Latitude-Longitude Grid

WRF Version 3 Release

Additions to WRF Version 2

- Map factors are generalized - m_x and m_y
 - Computational grid poles need not be geographic poles.
 - Limited area and nesting capable.
- Polar boundary conditions
- Polar filtering

ARW Map Projections

ARW map factors

Map-scale factor: $m_x = \frac{\Delta x}{\text{distance on the earth}}, m_y = \frac{\Delta y}{\text{distance on the earth}}$

Continuity equation:

$$\frac{\partial \mu}{\partial t} + m_x m_y \left[\frac{\partial}{\partial x} \left(\frac{\mu u}{m_y} \right) + \frac{\partial}{\partial y} \left(\frac{\mu v}{m_x} \right) \right] + \frac{\partial}{\partial \eta} (\mu \omega) = 0$$

$$\propto \frac{1}{\text{control volume area}}$$

Control volume:

Lat-Long Grid Global WRF

Lat-Long WRFV3

Polar boundary condition (pole point).

Meridional velocity (v) is undefined at the poles.

Zero meridional flux at the poles (cell-face area is zero).

v (poles) only needed for meridional derivative of v near the poles (some approximation needed).

All other meridional derivatives are well-defined near/at poles.

ARW Filters: Polar Filter

Converging gridlines severely limit timestep.
The polar filter removes this limitation.

Filter procedure - Along a grid latitude circle:

1. Fourier transform variable.
2. Filter Fourier coefficients.
3. Transform back to physical space.

Filter Coefficient $a(k)$, $\psi_o = 45^\circ$

$$\hat{\phi}(k)_{filtered} = a(k) \hat{\phi}(k), \quad \text{for all } k$$

$$a(k) = \min \left[1., \max \left(0., \left(\frac{\cos \psi}{\cos \psi_o} \right)^2 \frac{1}{\sin^2(\pi k/n)} \right) \right]$$

k = dimensionless wavenumber

$\hat{\phi}(k)$ = Fourier coefficients from forward transform

$a(k)$ = filter coefficients

ψ = latitude ψ_o = polar filter latitude, filter when $|\psi| > \psi_o$

WRF ARW Model Integration Procedure

Begin time step

End time step

WRF ARW Model Integration Procedure

Begin time step

End time step

Timestep limited by minimum Δx outside of polar-filter region.

ARW Model: Coordinate Options

1. Cartesian geometry:
idealized cases
2. Lambert Conformal:
mid-latitude applications
3. Polar Stereographic:
high-latitude applications
4. Mercator:
low-latitude applications
5. Latitude-Longitude (new in ARW V3)
global
regional

Projections 1-4 are isotropic ($m_x = m_y$)

Latitude-Longitude projection is anisotropic ($m_x \neq m_y$)

ARW Model: Boundary Condition Options

Lateral boundary conditions

1. Specified (Coarse grid, real-data applications).
2. Open lateral boundaries (gravity-wave radiative).
3. Symmetric lateral boundary condition (free-slip wall).
4. Periodic lateral boundary conditions.
5. Nested boundary conditions (specified).

Top boundary conditions

1. Constant pressure.

Bottom boundary conditions

1. Free slip.
2. Various B.L. implementations of surface drag, fluxes.

ARW Model: Nesting

2-way nesting

1. Multiple domains run concurrently
2. Multiple levels, multiple nests per level
3. Any integer ratio grid size and time step
4. Parent domain provides nest boundaries
5. Nest feeds back interior values to parent

1-way nesting

1. Parent domain is run first
2. *ndown* uses coarse output to generate nest boundary conditions
3. Nest initial conditions from fine-grid input file
4. Nest is run after *ndown*

WRF ARW code

WRF ARW Tech Note

A Description of the Advanced Research WRF Version 3 (June 2008)

<http://www.mmm.ucar.edu/wrf/users/pub-doc.html>
