

# **WRF Registry and Examples**

# WRF Registry and Examples

John Michalakes, NCAR

Michael Duda, NCAR

Dave Gill, NCAR

[WRF Software Architecture Working Group](#)

# Outline

- Registry Mechanics
- 
- Examples

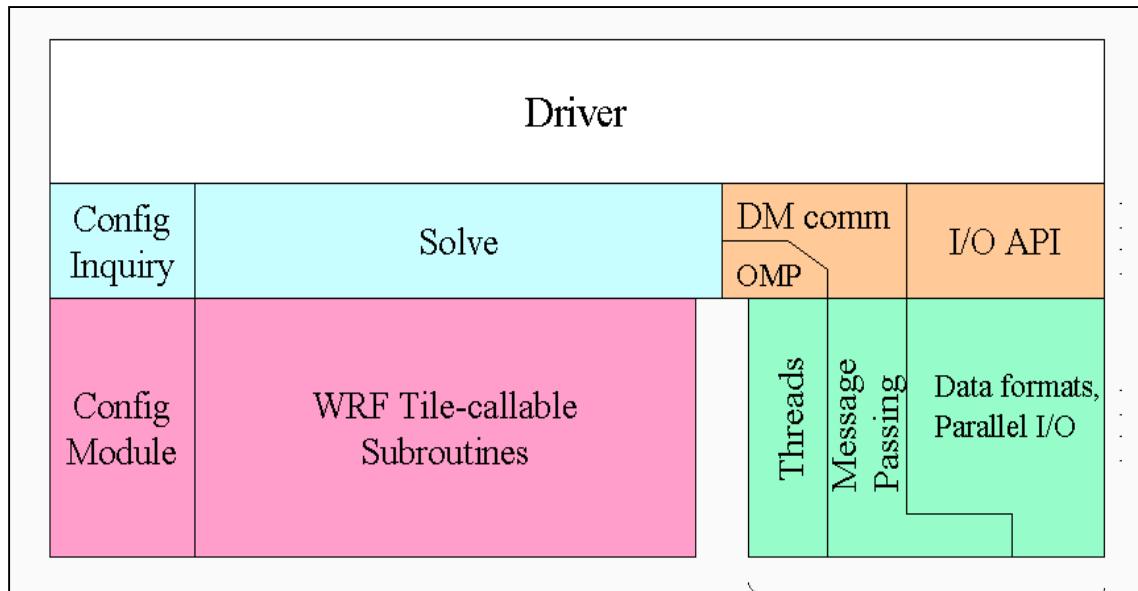

# Introduction – Intended Audience

- Intended audience for this tutorial session: scientific users and others who wish to:
  - Understand **overall design** concepts and motivations
  - **Work** with the code
  - **Extend/modify** the code to enable their work/research
  - Address **problems** as they arise
  - Adapt the code to take advantage of **local computing** resources

# Introduction – WRF Resources

- WRF project home page
  - <http://www.wrf-model.org>
- WRF users page (linked from above)
  - <http://www.mmm.ucar.edu/wrf/users>
- On line documentation (also from above)
  - [http://www.mmm.ucar.edu/wrf/WG2/software\\_v2](http://www.mmm.ucar.edu/wrf/WG2/software_v2)
- WRF user services and help desk
  - [wrfhelp@ucar.edu](mailto:wrfhelp@ucar.edu)

# WRF Software Architecture

- Hierarchical software architecture
  - Insulate scientists' code from parallelism and other architecture/implementation-specific details
  - Well-defined interfaces between layers, and external packages for communications, I/O, and model coupling facilitates code reuse and exploiting of community infrastructure, e.g. ESMF.

# WRF Registry

- "Active data-dictionary" for managing WRF data structures
  - Database describing attributes of model state, intermediate, and configuration data
    - Dimensionality, number of time levels, staggering
    - Association with physics
    - I/O classification (history, initial, restart, boundary)
    - Communication points and patterns
    - Configuration lists (e.g. namelists)
    - Nesting up- and down-scale interpolation

# WRF Registry

- "Active data-dictionary" for managing WRF data structures
  - Program for auto-generating sections of WRF from database:
    - 2000 - 3000 Registry entries  $\Rightarrow$  300-thousand lines of automatically generated WRF code
    - Allocation statements for state data and I1 data
    - Interprocessor communications: Halo and periodic boundary updates, transposes
    - Code for defining and managing run-time configuration information
    - Code for forcing, feedback, shifting, and interpolation of nest data

# WRF Registry

- Why?
  - Automates time consuming, repetitive, error-prone programming
  - Insulates programmers and code from package dependencies
  - Allow rapid development
  - Documents the data
- A Registry file is available for each of the dynamical cores, plus special purpose packages
- Reference: Description of WRF Registry, [http://www.mmm.ucar.edu/wrf/WG2/software\\_v2](http://www.mmm.ucar.edu/wrf/WG2/software_v2)

# Registry Data Base

- Currently implemented as a text file: **Registry/Registry.EM**
- Types of entry:
  - *Dimspec* – Describes dimensions that are used to define arrays in the model
  - *State* – Describes state variables and arrays in the domain structure
  - *I1* – Describes local variables and arrays in solve
  - *Typedef* – Describes derived types that are subtypes of the domain structure

# Registry Data Base

- Types of entry:
  - *Rconfig* – Describes a configuration (e.g. namelist) variable or array
  - *Package* – Describes attributes of a package (e.g. physics)
  - *Halo* – Describes halo update interprocessor communications
  - *Period* – Describes communications for periodic boundary updates
  - *Xpose* – Describes communications for parallel matrix transposes
  - *Include* – Similar to a CPP #include file

# Registry State Entry

#	Type	Sym	Dims	Use	Tlev	Stag	IO	Dname	Descrip
state	real	u	ikjb	dyn_em	2	x	i01rhkusdf	"U"	"X WIND COMPONENT"

- Elements
  - *Entry*: The keyword “state”
  - *Type*: The type of the state variable or array (real, double, integer, logical, character, or derived)
  - *Sym*: The symbolic name of the variable or array
  - *Dims*: A string denoting the dimensionality of the array or a hyphen (-)
  - *Use*: A string denoting association with a solver or 4D scalar array, or a hyphen
  - *NumTLev*: An integer indicating the number of time levels (for arrays) or hyphen (for variables)

# Registry State Entry

#	Type	Sym	Dims	Use	Tlev	Stag	IO	Dname	Descrip
state	real	u	ikjb	dyn_em	2	x	i01rhkusdf	"U"	"X WIND COMPONENT"

- Elements
  - *Stagger*: String indicating staggered dimensions of variable (X, Y, Z, or hyphen)
  - *IO*: String indicating whether and how the variable is subject to I/O and Nesting
  - *DName*: Metadata name for the variable
  - *Units*: Metadata units of the variable
  - *Descrip*: Metadata description of the variable

# Registry State Entry

#	Type	Sym	Dims	Use	Tlev	Stag	IO	Dname	Descrip
state	real	u	ikjb	dyn_em	2	x	i01rhusdf	"U"	"X WIND COMPONENT"

- This single entry results in over 100 lines of code automatically added to more than 40 different locations in the WRF model, the real and ideal initialization programs, and in the WRF-Var package
- Nesting code to interpolate, force, feedback, and smooth u
- Addition of u to the input, restart, history, and LBC I/O streams

# Registry State Entry

#	Type	Sym	Dims	Use	Tlev	Stag	IO	Dname	Descrip
state	real	u	ikjb	dyn_em	2	x	i01rhusdf	"U"	"X WIND COMPONENT"

Declaration and dynamic allocation of arrays in TYPE(domain)

Two 3D state arrays corresponding to the 2 time levels of U

u\_1 ( ims:ime , kms:kme , jms:jme )

u\_2 ( ims:ime , kms:kme , jms:jme )

Eight LBC arrays for boundary and boundary tendencies (dimension example for x BC)

u\_b[xy][se] ( jms:jme, kms:kme, spec\_bdy\_width, 4 )

u\_bt[xy][se] ( jms:jme, kms:kme, spec\_bdy\_width, 4 )

## State Entry: Defining a variable-set for an I/O stream

- Fields are added to a variable-set on an I/O stream in the Registry

#	Type	Sym	Dims	Use	Tlev	Stag	IO	Dname	Descrip
state	real	u	ikjb	dyn_em	2	x	i01rhusdf	"U"	"X WIND COMPONENT"

**IO** is a string that specifies if the variable is to be subject to initial, restart, history, or boundary I/O. The string may consist of 'h' (subject to history I/O), 'i' (initial dataset), 'r' (restart dataset), or 'b' (lateral boundary dataset). The 'h', 'r', and 'i' specifiers may appear in any order or combination.

The 'h' and 'i' specifiers may be followed by an optional integer string consisting of '0', '1', ..., '9'. Zero denotes that the variable is part of the principal input or history I/O stream. The characters '1' through '9' denote one of the auxiliary input or history I/O streams.

**usdf** refers to nesting options: **u = UP**, **d = DOWN**, **s = SMOOTH**, **f = FORCE**

## State Entry: Defining Variable-set for an I/O stream

**irh** -- The state variable will be included in the WRF model input, restart, and history I/O streams

**irh13** -- The state variable has been added to the first and third auxiliary history output streams; it has been removed from the principal history output stream, because zero is not among the integers in the integer string that follows the character 'h'

**rh01** -- The state variable has been added to the first auxiliary history output stream; it is also retained in the principal history output

**i205hr** -- Now the state variable is included in the principal input stream as well as auxiliary inputs 2 and 5. Note that the order of the integers is unimportant. The variable is also in the principal history output stream

**ir12h** -- No effect; there is only 1 restart data stream

**i01** -- Data goes into real and into WRF (1 = real program is by convention)

**i1** -- Data goes into real only

# Rconfig Entry

#	Type	Sym	How set	Nentries	Default
rconfig	integer	spec_bdy_width	namelist, bdy_control	1	1

- This defines namelist entries
- Elements
  - *Entry*: the keyword “rconfig”
  - *Type*: the type of the namelist variable (integer, real, logical, string )
  - *Sym*: the name of the namelist variable or array
  - *How set*: indicates how the variable is set: e.g. namelist or derived, and if namelist, which block of the namelist it is set in

# Rconfig Entry

#	Type	Sym	How set	Nentries	Default
rconfig	integer	spec_bdy_width	namelist,bdy_control	1	1

- This defines namelist entries
- Elements
  - *Nentries*: specifies the dimensionality of the namelist variable or array. If 1 (one) it is a variable and applies to all domains; otherwise specify `max_domains` (which is an integer parameter defined in `module_driver_constants.F`).
  - *Default*: the default value of the variable to be used if none is specified in the namelist; hyphen (-) for no default

# Rconfig Entry

#	Type	Sym	How set	Nentries	Default
rconfig	integer	spec_bdy_width	namelist, bdy_control	1	1

- Result of this Registry Entry:
  - Define an namelist variable “**spec\_bdy\_width**” in the **bdy\_control** section of namelist.input
  - Type **integer** (others: real, logical, character)
  - If this is first entry in that section, define “**bdy\_control**” as a new section in the namelist.input file
  - Specifies that bdy\_control applies to **all domains** in the run

```
--- File: namelist.input ---  
  
&bdy_control  
  spec_bdy_width      = 5,  
  spec_zone            = 1,  
  relax_zone           = 4,  
  . . .  
 /
```

# Rconfig Entry

#	Type	Sym	How set	Nentries	Default
rconfig	integer	spec_bdy_width	namelist,bdy_control	1	1

- Result of this Registry Entry:
  - if **Nentries** is “**max\_domains**” then the entry in the namelist.input file is a comma-separate list, each element of which applies to a separate domain
  - The single entry in the Registry file applies to each of the separate domains

--- File: namelist.input ---

```
&bdy_control
  spec_bdy_width      = 5,
  spec_zone           = 1,
  relax_zone          = 4,
  . . .
/
```

# Rconfig Entry

#	Type	Sym	How set	Nentries	Default
rconfig	integer	spec_bdy_width	namelist,bdy_control	1	1

- Result of this Registry Entry:
  - Specify a **default** value of “1” if nothing is specified in the namelist.input file
  - In the case of a multi-process run, generate code to read in the bdy\_control section of the namelist.input file on one process and broadcast the value to all other processes

```
--- File: namelist.input ---  
  
&bdy_control  
  spec_bdy_width      = 5,  
  spec_zone           = 1,  
  relax_zone          = 4,  
  . . .  
 /
```

# Package Entry

- Elements
  - *Entry*: the keyword “package”,
  - *Package name*: the name of the package: e.g. “kesslerscheme”
  - *Associated rconfig choice*: the name of a rconfig variable and the value of that variable that chooses this package

```
# specification of microphysics options
package  passiveqv    mp_physics==0      -      moist:qv
package  kesslerscheme mp_physics==1      -      moist:qv,qc,qr
package  linscheme     mp_physics==2      -      moist:qv,qc,qr,qi,qs,qg
package  ncepcloud3   mp_physics==3      -      moist:qv,qc,qr
package  ncepcloud5   mp_physics==4      -      moist:qv,qc,qr,qi,qs

# namelist entry that controls microphysics option
rconfig  integer       mp_physics      namelist,physics      max_domains      0
```

# Package Entry

- Elements
  - *Package state vars*: unused at present; specify hyphen (-)
  - *Associated variables*: the names of 4D scalar arrays (`moist`, `chem`, `scalar`) and the fields within those arrays this package uses, and the state variables (`state:u_gc`, ...)

```
# specification of microphysics options
package  passiveqv      mp_physics==0      -          moist:qv
package  kesslerscheme   mp_physics==1      -          moist:qv,qc,qr
package  linscheme       mp_physics==2      -          moist:qv,qc,qr,qi,qs,qg
package  ncepcloud3     mp_physics==3      -          moist:qv,qc,qr
package  ncepcloud5     mp_physics==4      -          moist:qv,qc,qr,qi,qs

# namelist entry that controls microphysics option
rconfig  integer        mp_physics      namelist,physics      max_domains      0
```

# Package Entry

```
USE module_state_descriptions

...
Micro_select : SELECT CASE ( mp_physics )

    CASE ( KESSLERSCHEME )
        CALL kessler ( ...

    CASE ( THOMPSON )
        CALL mp_gt_driver ( ...

    ...
END SELECT micro_select
```

Packages define automatically enumerated types to avoid the usual tests ( i.e. option #17 for microphysics)

# Halo Entry

- Elements
  - *Entry*: the keyword “halo”,
  - *Communication name*: given to the particular communication, must be identical in the source code (case matters!)
  - *Associated dynamical core*: dyn\_em XOR dyn\_nmm are acceptable
  - *Stencil size*: 4, or  $(2n+1)^{2-1}$  (i.e. 8, 24, 48; semi-colon separated)
  - *Which variables*: names of the variables (comma separated)

```
# Halo update communications
halo      HALO_EM_TKE_C dyn_em 4:ph_2,phb
```

# HALO Entry

Place communication in dyn\_em/solve\_em.F

```
#ifdef DM_PARALLEL
#    include "HALO_EM_TKE_C.inc"
#endif
```

```
# Halo update communications
halo      HALO_EM_TKE_C dyn_em 4:ph_2,phb
```

# PERIOD and XPOSE Entry

- Elements
  - *Entry*: the keyword “period” or “xpose” (transpose)
  - *Communication name*: given to the particular communication, must be identical in the source code (case matters!)
  - *Associated dynamical core*: dyn\_em XOR dyn\_nmm are acceptable
  - *Stencil size for period*: # rows and columns to share for periodic lateral BCs
  - *Which variables for period*: names of the variables (comma separated)
  - *Which variables for xpose*: original variable (3d), x-transposed and y-transposed fields

```
# Period update communications
period PERIOD_EM_COUPLE_A dyn_em 2:mub,mu_1,mu_2
```

```
# Transpose update communications
xpose XPOSE_POLAR_FILTER_TOPO dyn_em t_init,t_xxx,dum_yyy
```

# Registry IO: registry.io\_boilerplate

- `include` – includes another file into the Registry file
  - *Entry:* the keyword “include”
  - *Name:* file name to include in the Registry file

**Entry**

**Name**

`include registry.io_boilerplate`

# Registry IO: registry.io\_boilerplate

- **rconfig** - namelist entries
  - *Entry*: the keyword “rconfig”,
  - *Type*: integer, logical, real
  - *Symbol*: name of variable in namelist
  - *How set*: name of the resident record (*usually*)
  - *Number of entries*: either “1” or “max\_domains”
  - *Default value*: what to define if not in namelist.input file
  - *NOT REQUIRED name and description*: for self documentation purposes

Entry	Type	Sym	How set
rconfig	character	auxinput5_inname	namelist,time_control

Num Entries	Default
1	"auxinput5_d<domain>_<date>"

<domain> expanded to 2-digit domain identifier

<date> expanded to the usual WRF “years down to seconds” date string

# Registry IO: registry.io\_boilerplate

Entry	Type	Sym	How set
rconfig character	auxinput5_outname		namelist,time_control
rconfig character	auxinput5_inname		namelist,time_control
rconfig integer	auxinput5_interval_mo		namelist,time_control
rconfig integer	auxinput5_interval_d		namelist,time_control
rconfig integer	auxinput5_interval_h		namelist,time_control
rconfig integer	auxinput5_interval_m		namelist,time_control

output  
streams

# Registry Data Base - Review

- Currently implemented as a text file: **Registry/Registry.EM**
- Types of entry:
  - *Dimspec* – Describes dimensions that are used to define arrays in the model
  - *State* – Describes state variables and arrays in the domain structure
  - *I1* – Describes local variables and arrays in solve
  - *Typedef* – Describes derived types that are subtypes of the domain structure

# Registry Data Base - Review

- Types of entry:
  - *Rconfig* – Describes a configuration (e.g. namelist) variable or array
  - *Package* – Describes attributes of a package (e.g. physics)
  - *Halo* – Describes halo update interprocessor communications
  - *Period* – Describes communications for periodic boundary updates
  - *Xpose* – Describes communications for parallel matrix transposes
  - *include* – Similar to a CPP #include file

# Outline

- Registry Mechanics
  - Examples
    - 1) Add a variable to the namelist
    - 2) Add an array
    - 3) Compute a diagnostic
    - 4) Add a physics package

## Example 1: Add a variable to the namelist

- Use the examples for the **rconfig** section of the Registry
- Find a namelist variable similar to what you want
  - Integer *vs* real *vs* logical *vs* character
  - Single value *vs* value per domain
  - Select appropriate namelist record
- Insert your mods in all appropriate Registry files
- Remember that ALL Registry changes require that the WRF code be cleaned and rebuilt

## Example 1: Add a variable to the namelist

- Adding a variable to the namelist requires the inclusion of a new line in the Registry file:

```
rconfig integer my_option_1 namelist,time_control 1 0 - "my_option_1" "test namelist option"  
rconfig integer my_option_2 namelist,time_control max_domains 0
```

- Accessing the variable is through an automatically generated function:

```
USE module_configure  
INTEGER :: my_option_1 , my_option_2  
  
CALL nl_get_my_option_1( 1, my_option_1 )  
CALL nl_set_my_option_2( grid%id, my_option_2 )
```

## Example 1: Add a variable to the namelist

- You also have access to the namelist variables from the grid structure ...

```
SUBROUTINE foo ( grid , ... )
```

```
  USE module_domain
```

```
  TYPE(domain) :: grid
```

```
  print *,grid%my_option_1
```

## Example 1: Add a variable to the namelist

- ... and you also have access to the namelist variables from config\_flags

```
SUBROUTINE foo2 ( config_flags , ... )  
  
USE module_configure  
TYPE(grid_config_rec_type) :: config_flags  
  
print *,config_flags%my_option_2
```

## Example 1: Add a variable to the namelist

- What your variable looks like in the namelist.input file

```
&time_control
run_days                  = 0,
run_hours                  = 0,
run_minutes                = 40,
run_seconds                = 0,
start_year                 = 2006, 2006, 2006,
my_option_1                = 17
my_option_2                = 1, 2, 3
```

# Examples

- 1) Add a variable to the namelist
- 2) Add an array to solver, and IO stream
- 3) Compute a diagnostic
- 4) Add a physics package

## Example 2: Add an Array

- Adding a state array to the solver, requires adding a single line in the Registry
- Use the previous Registry instructions for a **state** or **l1** variable
- Select a variable similar to one that you would like to add
  - 1d, 2d, or 3d
  - Staggered (X, Y, Z, or not “-”, *do not leave blank*)
  - Associated with a package
  - Part of a 4d array
  - Input (012), output, restart
  - Nesting, lateral forcing, feedback

## Example 2: Add an Array

- Copy the “similar” field’s line and make a few edits
- Remember, no Registry change takes effect until a “clean -a” and rebuild
- Always modify Registry.*core\_name*

```
state real h_diabatic ikj misc 1 - r \
      "h_diabatic" "PREVIOUS TIMESTEP CONDENSATIONAL HEATING"

state real msft ij misc 1 - i012rhdu=(copy_fcnm) \
      "MAPFAC_M" "Map scale factor on mass grid"

state real ht ij misc 1 - i012rhdus \
      "HGT" "Terrain Height"

state real ht_input ij misc 1 - -
      "HGT_INPUT" "Terrain Height from FG Input File"

state real TSK_SAVE ij misc 1 - -
      "TSK_SAVE" "SURFACE SKIN TEMPERATURE" "K"
```

# Examples

- 1) Add a variable to the namelist
- 2) Add an array
- 3) Compute a diagnostic
- 4) Add a physics package

## Example 3: Compute a Diagnostic

- Problem: Output global average and global maximum and lat/lon location of maximum for 10 meter wind speed in WRF
- Steps:
  - Modify solve to compute wind-speed and then compute the local sum and maxima at the end of each time step
  - Use reduction operations built-in to WRF software to compute the global qualities
  - Output these on one process (process zero, the “monitor” process)

## Example 3: Compute a Diagnostic

- Compute local sum and local max and the local indices of the local maximum

```
--- File: dyn_em/solve_em.F (near the end) ---

! Compute local maximum and sum of 10m wind-speed
sum_ws = 0.
max_ws = 0.
DO j = jps, jpe
    DO i = ips, ipe
        wind_vel = sqrt( grid%u10(i,j)**2+ grid%v10(i,j)**2 )
        IF ( wind_vel .GT. max_ws ) THEN
            max_ws = wind_vel
            idex = i
            jdex = j
        ENDIF
        sum_ws = sum_ws + wind_vel
    ENDDO
ENDDO
```

## Example 3: Compute a Diagnostic

- Compute global sum, global max, and indices of the global max (WRF intrinsics)

```
! Compute global sum
sum_ws = wrf_dm_sum_real ( sum_ws )

! Compute global maximum and associated i,j point
CALL wrf_dm_maxval_real ( max_ws, idex, jdex )
```

## Example 3: Compute a Diagnostic

- On the process that contains the maximum value, obtain the latitude and longitude of that point; on other processes set to an artificially low value.
- The use parallel reduction to store that result on every process

```
IF ( ips .LE. idex .AND. idex .LE. ipe .AND. &
      jps .LE. jdex .AND. jdex .LE. jpe ) THEN
      glat = grid%xlat(idex,jdex)
      glon = grid%xlong(idex,jdex)
ELSE
      glat = -99999.
      glon = -99999.
ENDIF

! Compute global maximum to find glat and glon
glat = wrf_dm_max_real ( glat )
glon = wrf_dm_max_real ( glon )
```

## Example 3: Compute a Diagnostic

- Output the value on process zero, the “monitor”

```
! Print out the result on the monitor process
IF ( wrf_dm_on_monitor() ) THEN
  WRITE(outstring,*) 'Avg. ',sum_ws/((ide-ids+1)*(jde-jds+1))
  CALL wrf_message ( TRIM(outstring) )
  WRITE(outstring,*) 'Max. ',max_ws,' Lat. ',glat,&
                    ' Lon. ',glon
  CALL wrf_message ( TRIM(outstring) )
ENDIF
```

## Example 3: Compute a Diagnostic

- Output from process zero of an  $n$  process run

```
--- Output file: rsl.out.0000 ---
. . .
Avg.      5.159380
Max.      15.09370      Lat.      37.25022      Lon.     -67.44571
Timing for main: time 2000-01-24_12:03:00 on domain    1:     8.96500 elapsed secs.
Avg.      5.166167
Max.      14.97418      Lat.      37.25022      Lon.     -67.44571
Timing for main: time 2000-01-24_12:06:00 on domain    1:     4.89460 elapsed secs.
Avg.      5.205693
Max.      14.92687      Lat.      37.25022      Lon.     -67.44571
Timing for main: time 2000-01-24_12:09:00 on domain    1:     4.83500 elapsed secs.
. . .
```

# Examples

- 1) Add a variable to the namelist
- 2) Add an array
- 3) Compute a diagnostic
- 4) Add a physics package

## Example 4: Input periodic SSTs

- Add a new physics package with time varying input source to the model
- This is how we could supply a time varying value to the model for a field that is traditionally fixed
- Example is sea surface temperature

## Example 4: Input periodic SSTs

- Problem: adapt WRF to input a time-varying lower boundary condition, e.g. SSTs, from an input file for a new surface scheme
- Given: Input file in WRF I/O format containing 12-hourly SST's
- Modify WRF model to read these into a new state array and make available to WRF surface physics

## Example 4: Input periodic SSTs

- Steps
  - Add a new state variable and definition of a new surface layer package (that will use the variable) to the Registry
  - Add to variable stream for an unused Auxiliary Input stream
  - Adapt physics interface to pass new state variable to physics
  - Setup namelist to input the file at desired interval

## Example 4: Input periodic SSTs

- Add a new state variable to Registry/Registry.EM or Registry/Registry.NMM and put it in the variable set for input on AuxInput #4

```
#      type  symbol dims use   tl stag   io      dname      description      units
state real   nsst    ij   misc  1  -   i4rh  "NEW_SST"  "Time Varying SST"  "K"
```

- Also added to History and Restart
- Result:
  - 2-D variable named **nsst** defined and available in solve\_em
  - Dimensions: ims:ime, jms:jme
  - Input and output on the AuxInput #4 stream will include the variable under the name NEW\_SST

## Example 4: Input periodic SSTs

- Pass new state variable to surface physics

```
--- File: dyn_em/module_first_rk_step_part1.F ---  
  
CALL surface_driver( &  
    . . .  
! Optional  
&     ,QV_CURR=moist(imms,kms,jms,P_QV), F_QV=F_QV &  
&     ,QC_CURR=moist(imms,kms,jms,P_QC), F_QC=F_QC &  
&     ,QR_CURR=moist(imms,kms,jms,P_QR), F_QR=F_QR &  
&     ,OI_CURR=moist(imms,kms,jms,P_OI), F_OI=F_OI &  
&     ,QS_CURR=moist(imms,kms,jms,P_QS), F_QS=F_QS &  
&     ,QG_CURR=moist(imms,kms,jms,P_QG), F_QG=F_QG &  
&     ,NSST=grid%nsst & ! new  
&     ,CAPG=grid%capg, EMISS=grid%emiss, HOL=hol,MOL=grid%mol &  
&     ,RAINBL=grid%rainbl,SR=grid%em_sr &  
&     ,RAINNCV=grid%rainncv,REGIME=regime,T2=grid%t2,THC=grid%thc &  
    . . .
```

## Example 4: Input periodic SSTs

- Add new variable nsst to Physics Driver in Mediation Layer

```
--- File: phys/module_surface_driver.F ---  
  
SUBROUTINE surface_driver( &  
    . . .  
    ! Other optionals (more or less em specific)  
    & ,nsst &  
    & ,capg,emiss,hol,mol &  
    & ,rainncv,rainbl,regime,t2,thc &  
    & ,qsg,qvg,qcg,soilt1,tsnav &  
    & ,smfr3d,keepfr3dfflag &  
    . . .  
    . . .  
    ) )  
  
REAL, DIMENSION( ims:ime, jms:jme ), OPTIONAL, INTENT(INOUT) :: nsst
```

- By making this an “Optional” argument, we preserve the driver’s compatibility with other cores and with versions of WRF where this variable hasn’t been added.

## Example 4: Input periodic SSTs

- Add call to Model-Layer subroutine for new physics package to Surface Driver

```
--- File: phys/module_surface_driver ---  
  
!$OMP PARALLEL DO    &  
!$OMP PRIVATE ( ij, i, j, k )  
  DO ij = 1 , num_tiles  
    sfclay_select: SELECT CASE(sf_sfclay_physics)  
  
      CASE (SFCLAYScheme)  
        . . .  
        CASE (NEWSFCScheme) ! <- This is defined by the Registry "package" entry  
          IF (PRESENT(nsst)) THEN  
            CALL NEWSFCCHEME( &  
              nsst, &  
              ids,ide, jds,jde, kds,kde, &  
              ims,ime, jms,jme, kms,kme, &  
              i_start(ij),i_end(ij), j_start(ij),j_end(ij), kts,kte )  
          ELSE  
            CALL wrf_error_fatal('Missing argument for NEWScheme in surface driver')  
          ENDIF  
          . . .  
        END SELECT sfclay_select  
      ENDDO  
    !$OMP END PARALLEL DO
```

- Note the PRESENT test to make sure new optional variable nsst is available

## Example 4: Input periodic SSTs

- Add definition for new physics package NEWSCHEME as setting 4 for namelist variable `sf_sfclay_physics`

```
rconfig  integer  sf_sfclay_physics  namelist,physics  max_domains  0

package  sfclayscheme  sf_sfclay_physics==1      -          -
package  myjsfcscheme  sf_sfclay_physics==2      -          -
package  gfssfcscheme  sf_sfclay_physics==3      -          -
package  newsfcscheme  sf_sfclay_physics==4      -          -
```

- This creates a defined constant NEWSFCScheme and represents selection of the new scheme when the namelist variable `sf_sfclay_physics` is set to '4' in the `namelist.input` file
- **clean -a** and recompile so code and Registry changes take effect

## Example 4: Input periodic SSTs

- Setup namelist to input SSTs from the file at desired interval

```
--- File: namelist.input ---  
  
&time_control  
  . . .  
  auxinput4_inname      = "sst_input"  
  auxinput4_interval_h = 12  
  . . .  
 /  
  
  . . .  
&physics  
  sf_sfclay_physics   = 4, 4, 4  
  . . .  
 /
```

- Run code with `sst_input` file in run-directory

## Example 4: Input periodic SSTs

- A few notes...
  - The read times and the time-stamps in the input file must match exactly
  - We haven't done anything about what happens if the file runs out of time periods (the last time period read will be used over and over again, though you'll see some error messages in the output if you set debug\_level to be 1 or greater in namelist.input)
  - We haven't said anything about what generates sst\_input
