

# NCEP's WRF POST PROCESSOR (WPP)

Hui-Ya Chuang

*Presented by Matthew Pyle*

# Outline

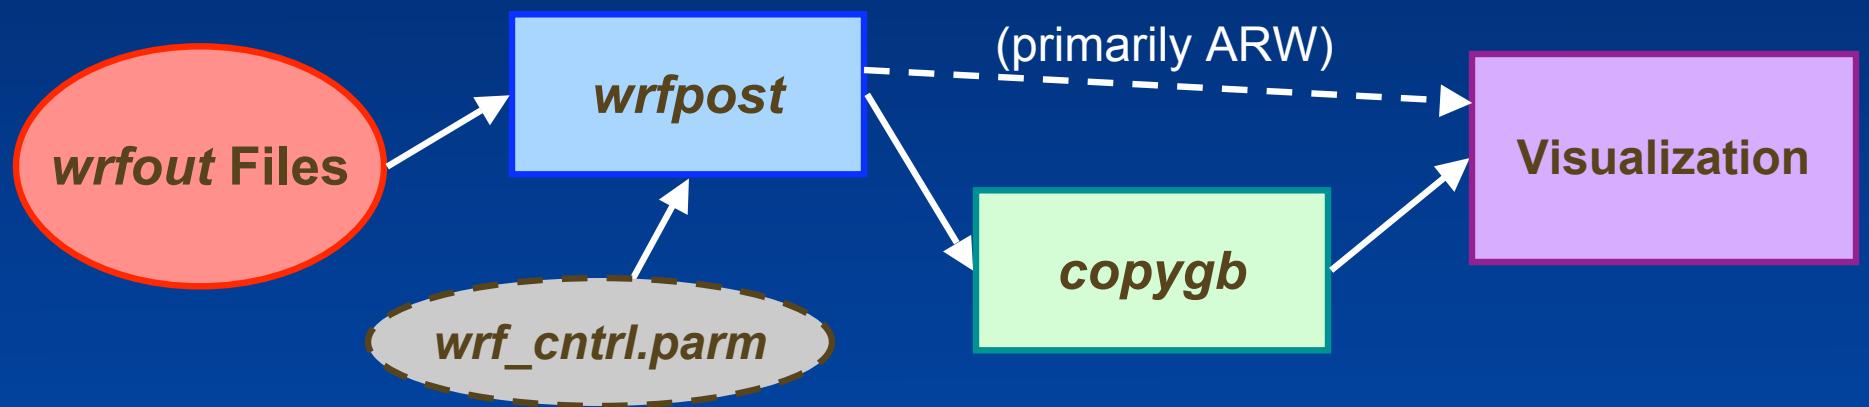

- Overview
- Components and Functions
- Sample fields generated
- Installation
- Running *wrfpost*
  - Controlling output generation
- Running *copygb*
  - Specifying target grid
- Visualization

# The critical big picture overview

- Processes model output from both the NMM and the ARW dynamical cores.
- The WRF post processor (WPP) generates output in GRIB.
- The WPP enables product generation on any output grid.

# Components of the WPP

The WPP has two components: wrfout and copygb.

# Functions and features of *wrfpost*

- Performs vertical interpolation onto isobaric and other non-model surfaces
- Computes diagnostic fields
- Destaggers wind onto mass points (ARW)
- An MPI-parallel code

# Functions of *copygb*

- Performs destaggering (NMM only) and **horizontal** interpolation to a defined output grid
  - Many visualization packages cannot properly handle staggered grids, so copygb is an important step for processing NMM core output (optional for ARW).
- Useful for both cores in creating an output grid not fixed by the model integration domain.

# Ingesting WRF model output

- wrfpost reads in WRF model output in either binary or netCDF format using the WRF I/O package.
- Users are encouraged to use netCDF formatted model output for simplicity. NCEP uses binary output for speed.

# Ingesting WRF model output

- The model fields read in by *wrfpost* for both dynamical cores are listed in the user guide (by WRF Registry file variable names) .
- These fields are automatically provided by the default WRF model Registry files.

# Fields generated by the WPP

- The WPP currently outputs 288 fields.
  - Complete list in the Post Processing Utilities Chapter of the user guide
- Sample fields generated by WPP:
  - 1) T, Z, humidity, wind, cloud water, cloud ice, rain, and snow on isobaric levels
  - 2) Shelter level T, humidity, and wind fields
  - 3) SLP (two kinds)
  - 4) Precipitation-related fields

# Fields generated by the WPP

- Sample fields generated by WPP (cont.):
  - 5) PBL-related fields
  - 6) Diagnostic fields
  - 7) Radiative fluxes
  - 8) Surface fluxes
  - 9) Cloud related fields
  - 10) Aviation products

# WPP download and compile

# Downloading the WPP source code

- The WPP source code can be obtained from:  
*<http://www.dtcenter.org/wrf-nmm/users/downloads>*
- The latest version available is:  
*WPPV3.2.tar.gz*
- Unpack the downloaded file:  
*tar –zxvf WPPV3.2.tar.gz*
- *cd* to newly created WPPV3/ directory

# WPPV3 directory “important” contents

- **scripts/**: sample scripts for running WPP and generating graphics
- **parm/**: contains the control file used when running the wrfpost
- **clean, configure, compile**: scripts used in the build process

# Compile source codes

- The build mechanism follows the WRF model build paradigm:

*./configure* : respond to screen prompts about target computing platform

*./compile >& compile\_wpp.log*

- The **arch/configure.defaults** file has compilation options for various platforms, and is where they can be modified (or where new computers/compilers might be added).

# Compile source codes (cont.)

- If compilation is successful, these three executables will be present in exec/ :

*copygb.exe*

*ndate.exe*

*wrfpost.exe*

# Running wrfout and copygb

# *wrfpost* needs three input files to run:

- *itag*: specifies details of WRF model output to process

wrfout\_d01\_2010-06-27\_00:00:00 ← *WRF history filename*  
netcdf ← *WRF output format (netcdf/binary)*  
2010-06-27\_00:00:00 ← *validation time*  
NMM ← *model name (NMM/NCAR)*

- *wrf\_cntrl.parm*: control file specifying fields/levels to output
  - *eta\_micro\_lookup.dat*: binary look-up table for Ferrier MP
- \* In the sample *run\_wrfpost\** scripts, these files are generated on the fly or are automatically linked.

## wrfpost control file: *wrf\_cntrl.parm*

- Users specify which fields or which level(s) of fields to output by modifying control file, e.g.,

(PRESS ON MDL SFCS ) SCAL=(**6.0**)

GRIB packing  
precision\*\*

L=(11000 00000 00000 00000 00000 00000 00000...)

(HEIGHT ON MDL SFCS ) SCAL=(**6.0**)

L=(11000 00000 00000 00000 00000 00000 00000...)

*Each column represents a single model/isobaric level:  
“1” = output, “0” = no output*

Product description – wrfpost code  
keys on these character strings.

\*\* larger values → more  
precision, but larger GRIB files.

## *wrfpost* control file: *wrf\_cntrl.parm*

- The included *wrf\_cntrl.parm* file has entries for every possible output field.
- The “Fields produced by *wrfpost*” table in the user’s guide may help understand the character string abbreviations used in the control file.

# Outputting fields on different vertical coordinates

- *wrfout* outputs on several vertical coordinates:
  - Native model levels
  - 47 isobaric levels
  - 7 **flight levels** above MSL: 914, 1524, 1829, 2134, 2743, 3658, and 6000 m
  - 6 **PBL layers**: each averaged over 30 hPa AGL layer
  - 2 **AGL levels**: 1000 & 4000 m (radar reflectivity).
- Except for AGL and isobaric levels, vertical levels are counted from the ground surface up in *wrf\_cntrl.parm*.

# Examples

- Output T every 50 hPa from 50 hPa to 1000 hPa:

```
(TEMP ON PRESS SFCS ) SCAL=( 4.0)  
L=(00000 01001 01010 10101 01010 10101 01010 10101 01010 10000...)
```

From left to right, the isobaric levels increase 2, 5, 7, 10, 20, 30, 50, 70, then 75-1000 hPa every 25 hPa.

- Output instantaneous surface sensible heat flux:

```
(INST SFC SENHEAT FX ) SCAL=( 4.0)  
L=(10000 00000 00000 00000 00000 00000 00000 00000 00000 00000...)
```

# Examples

- Do not output cloud top height:

```
(CLOUD TOP HEIGHT      ) SCAL=( 4.0)
L=(00000 00000 00000 00000 00000 00000 00000 00000 00000 00000 00000...)
```

- Output the U-wind component at the 5 lowest model levels:

```
(U WIND ON MDL SFCS   ) SCAL=( 4.0)
L=(11111 00000 00000 00000 00000 00000 00000 00000 00000 00000 00000...)
```

# *copygb* target grid definition

- The generic command to run copygb and horizontally interpolate onto a new grid is:  
`copygb.exe –xg”${grid}” in.grb out.grb`
- Three options on how to specify the target \$grid:
  1. Pre-defined NCEP standard grid number
  2. Grid navigation file created by *wrfpost* (NMM only)
  3. User-defined grid definition

# Run *copygb* – Option 1

- Interpolate to a pre-defined NCEP standard grid (restrictive but simple)
  - For example, to interpolate onto NCEP grid 212:  
`copygb.exe –xg212 in.grb out.grb`

Descriptions of NCEP grids are available online:

<http://www.nco.ncep.noaa.gov/pmb/docs/on388/tableb.html>

# Run *copygb* – Option 2

- Read in grid navigation file created by *wrfpost* (NMM only, simple, restrictive)
  - Running *wrfpost* on WRF-NMM output produces two ASCII files containing grid navigation information which is similar in domain and grid spacing to the model integration domain.
    - *copygb\_gridnav.txt* for a Lambert Conformal grid
    - *copygb\_hwrf.txt* for a regular Lat-Lon grid

For example:

```
read nav < 'copygb_gridnav.txt'  
copygb.exe -xg"${nav}" in.grb out.grb
```

# Run *copygb* – Option 3a

- Create a user-defined Lambert Conformal grid by specifying a full set of grid parameters (complicated but flexible).

copygb.exe –xg"255 3 NX NY STARTLAT STARTLON 8 CENLON  
DX DY 0 64 TRUELAT1 TRUELAT2 " in.grb out.grb

indicates user-defined grid

map type (3=LC)

# of points

SW corner (millidegrees)

Proj cent lon (millidegrees)

horizontal spacing (meters)

Proj true latitudes (millidegrees)

copygb –xg"255 3 185 129 12190 -133459 8 -95000  
40635 40635 0 64 25000 25000" in.grb out.grb

# Run *copygb* – Option 3b

- Create a user-defined Polar Stereographic grid by specifying a full set of grid parameters (complicated but flexible).

**map type  
(5=STR)**

```
copygb.exe -xg"255 5 NX NY STARTLAT STARTLON 8 CENLON  
DX DY 0 64" in.grb out.grb
```

**Center flag (0=NH ; 1=SH)**

---

```
copygb -xg"255 5 580 548 10000 -128000 8 -105000  
15000 15000 0 64" in.grb out.grb
```

# Run *copygb* – Option 3c

- Create a user-defined Latitude-Longitude grid by specifying a full set of grid parameters (complicated but flexible).

map type  
(0=LTLN)

```
copygb.exe -xg"255 0 NX NY STARTLAT STARTLON 136
ENDLAT ENDLON DLAT DLON 64" in.grb out.grb
```

NE lat  
(millidegrees)

NE lon  
(millidegrees)

grid spacing  
(millidegrees)

---

```
copygb -xg"255 0 401 401 10000 -130000 136
50000 -90000 100 100 64" in.grb out.grb
```

# GRIB file visualization with GEMPAK

- The GEMPAK utility “nagrib” reads GRIB files from any non-staggered grid and generates GEMPAK-binary files that are readable by GEMPAK plotting programs
- GEMPAK can plot horizontal maps, vertical cross-sections, meteograms, and sounding profiles.
- Package download and user guide are available online:  
<http://my.unidata.ucar.edu/content/software/gempak/index.html>
- A sample script named *run\_wrfpostandgempak* is included in *scripts/* that can be used to run *wrfpost*, *copygb*, and then plot various fields using GEMPAK.
- Further details on this script and using GEMPAK are available in the user’s guide.

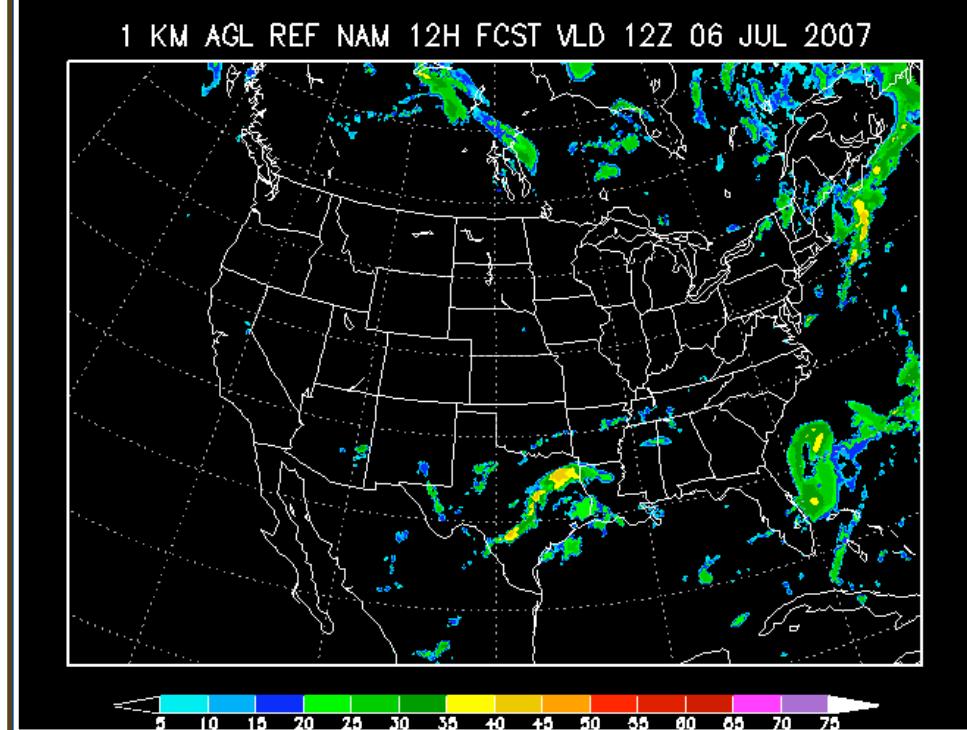

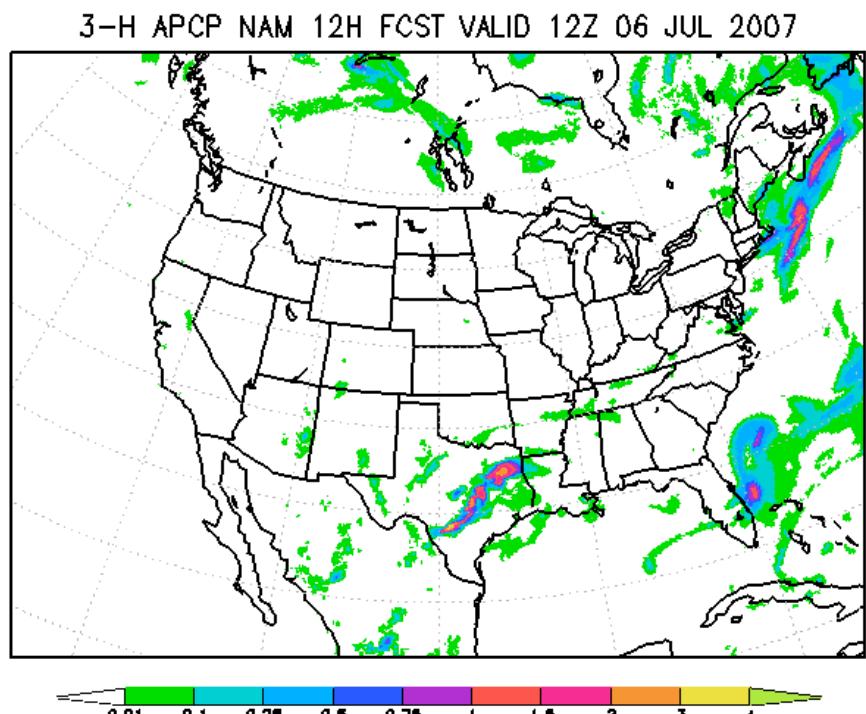

# Forecast plotted with GEMPAK : Precipitation and derived Radar reflectivity

# GRIB file visualization with GrADS

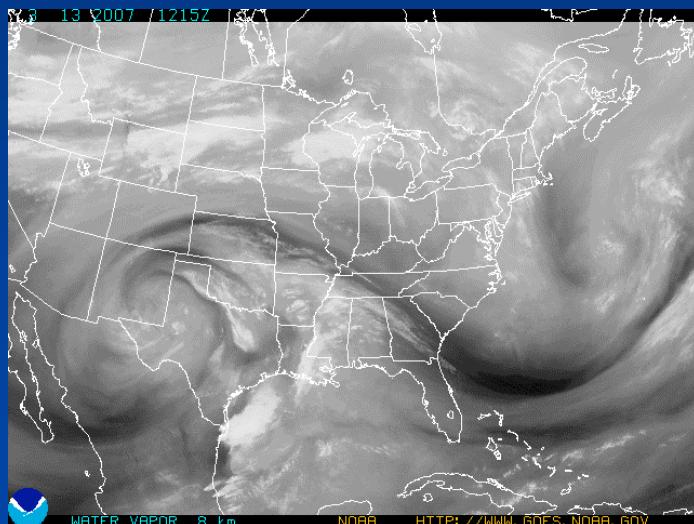

- GrADS also has utilities to read GRIB files on any non-staggered grids and generate GrADS “control” files. The utilities grib2ctl and gribmap are available via:  
<http://www.cpc.ncep.noaa.gov/products/wesley/grib2ctl.html>
- Package download and user guide for GrADS are available online:  
<http://grads.iges.org/grads/gadoc/>
- A sample script named *run\_wrfpostandgrads* is included in scripts/ that can be used to run *wrfpost*, *copygb*, and then plot various fields using GrADS.

# Forecast plotted with GrADS: Precipitation and derived Radar reflectivity

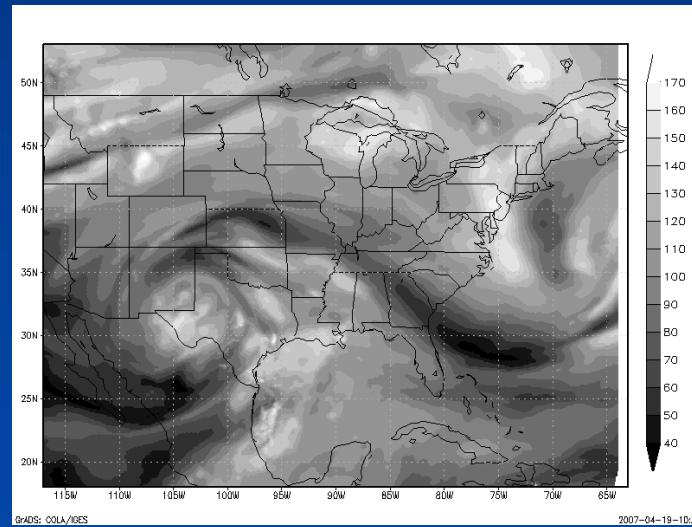

# Future plans

- NCEP/EMC and the DTC are transitioning to use the “unified” post by Spring 2011. Similar to WPP, but more capable and undergoing continual development.
- This change will add new products such as simulated brightness temperature (satellite look-alike products), and processing for global and regional lat/lon grids.
