profile

Surface radiative fluxes

## Illustration of Free Atmosphere Radiation Processes

# WRF Longwave Radiation Schemes (ra\_lw\_physics)

- Compute clear-sky and cloud upward and downward radiation fluxes
  - Consider IR emission from layers
  - Surface emissivity based on land-type
  - Flux divergence leads to cooling in a layer
  - Downward flux at surface important in land energy budget
  - IR radiation generally leads to cooling in clear air ( $\sim 2\text{K/day}$ ), stronger cooling at cloud tops and warming at cloud base

# Longwave Radiation schemes

ra_lw_physics	Scheme	Reference	Added

# Clear Sky: IR-active Gases

- H<sub>2</sub>O – from model prognostic vapor
- CO<sub>2</sub> – well-mixed, specified constant in whole atmosphere (CAM has yearly values)
  - For CAM, RRTM and RRTMG, GHG input file can update CO<sub>2</sub>, N<sub>2</sub>O and CH<sub>4</sub> (new in V3.5)
- O<sub>3</sub> – schemes have own climatologies
  - CAM has monthly, zonal, pressure-level data and RRTMG has this as an option (V3.5)
  - Others use single profiles (Goddard has 5 profiles to choose from)

## Radiation effects in clear sky

shortwave

longwave

# Spectral Bands

- Schemes divide IR spectrum into bands dominated by different absorption gases
- Typically 8-16 bands are used
- Computations use look-up tables for each band
  - Tables were generated from results of line-by-line calculations (LBLRTM models)

# Clouds

- All schemes interact with resolved model cloud fields allowing for ice and water clouds and precipitating species
- Clouds strongly affect IR at all wavelengths (considered “grey bodies”) and are almost opaque to it

# Cloud Fractions

- Schemes are capable of handling cloud fractions
- WRF can provide cloud fractions based on RH, but mostly the fraction is 0 or 1 in a grid box
- Cloud fraction methods
  - cldfra2 used by CAM and RRTMG
  - cldfra used by others except GFDL (computes its own)

# Cloud Fraction

- Overlap assumptions needed with multiple layers of varying fraction
  - Random overlap
  - Maximum overlap (clouds stacked as much as possible)
  - Maximum-random overlap (maximum for neighboring cloudy layers, random for layers separated by clear air)
- WRF schemes use max-random overlap

# WRF Shortwave Radiation Options (ra\_sw\_physics)

- Compute clear-sky and cloudy solar fluxes
- Include annual and diurnal solar cycles
- Most schemes consider downward and upward (reflected) fluxes
  - Dudhia scheme only has downward flux
- Primarily a warming effect in clear sky
- Important component of surface energy balance

# Shortwave Radiation schemes

ra_sw_physics	Scheme	Reference	Added
1	Dudhia	Dudhia (1989, JAS)	2000

99	GFDL	ARW NMM	Qc Qr Qi Qs	Max-rand overlap	Lat/date

# Clear Sky

- Main effect in troposphere is water vapor absorption (CO2 minor effect)
- Aerosols would be needed for additional scattering (WRF-Chem interacts with Goddard and RRTMG shortwave)
  - Dudhia scheme has tunable scattering
  - RRTMG has climatological aerosol input option (since V3.5)
    - aer\_opt=1 (Tegen global monthly climatology)

# Ozone

- Ozone heating maintains warm stratosphere
- Important for model tops above about 20 km (50 hPa)
- Usually specified from profiles as with longwave options
  - Dudhia scheme has no ozone effect
  - CAM, RRTMG have zonal climatology
- CAM, RRTMG, Goddard can also handle trace gases mainly N<sub>2</sub>O and CH<sub>4</sub> (set constant)

# Spectral Bands

- 11-19 spectral bands used by CAM, RRTMG and Goddard schemes
- Look-up tables

# Clouds and Cloud Fraction

- Similar considerations to longwave
- Interacts with model resolved clouds
- Fraction and overlap assumptions
- Cloud albedo reflection
- Surface albedo reflection based on land-surface type and snow cover

# Slope effects on shortwave

- In V3.2 available for all shortwave options
- Represents effect of slope on surface solar flux accounting for diffuse/direct effects
- slope\_rad=1: activates slope effects - may be useful for complex topography and grid lengths < 2 km.
- topo\_shading=1: shading of neighboring grids by mountains - may be useful for grid lengths < 1 km.

# radt

## Radiation time-step recommendation

- Radiation is too expensive to call every step
- Frequency should resolve cloud-cover changes with time
- $\text{radt}=1$  minute per km grid size is about right (e.g.  $\text{radt}=10$  for  $\text{dx}=10$  km)
- Each domain can have its own value but recommend using same value on all 2-way nests

# Surface Shortwave Fluxes

New in V3.5.1 (for all shortwave options)

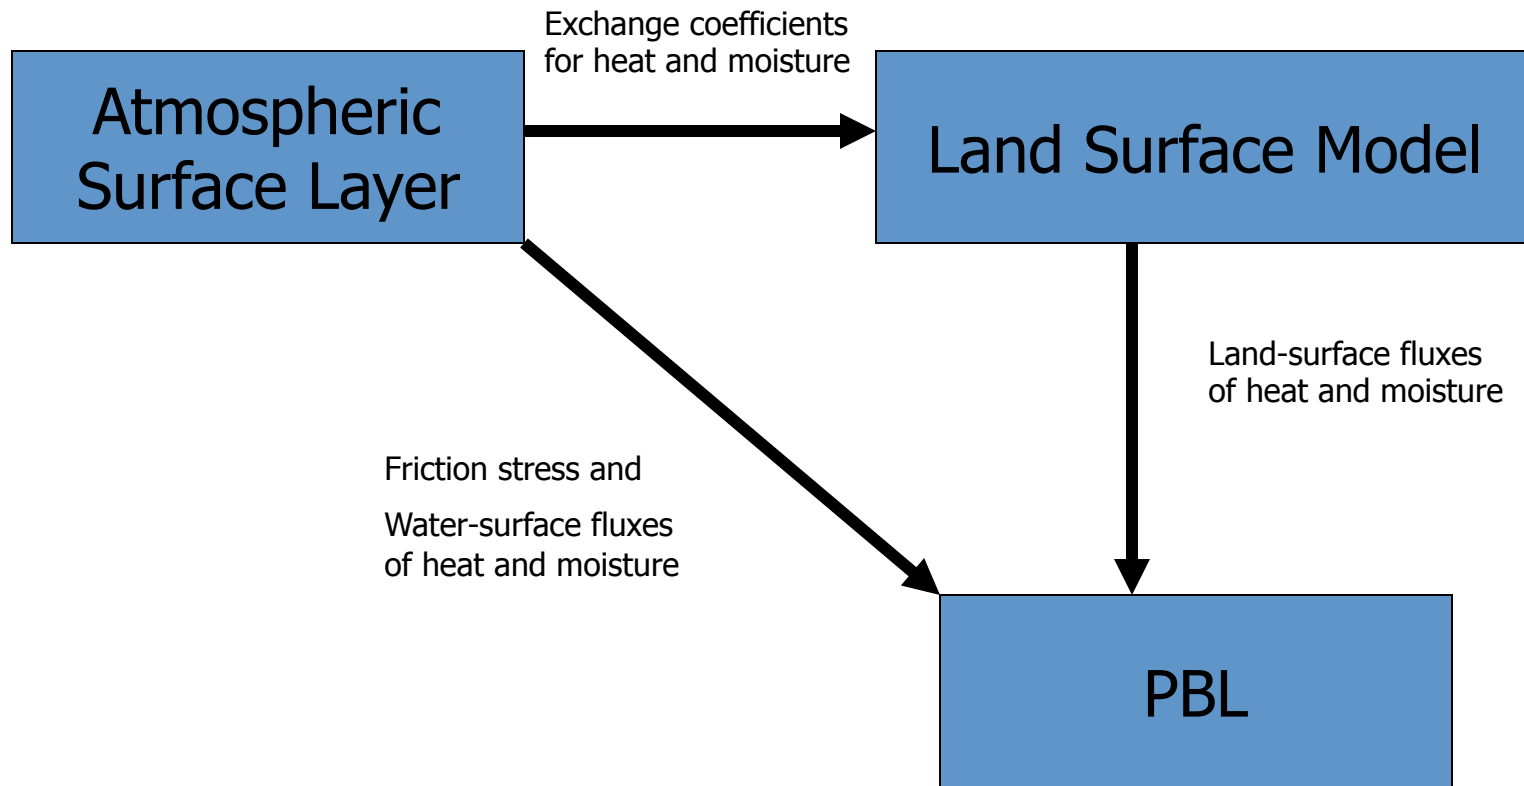

- `swint_opt=1` provides a smooth surface downward flux over time (interpolates using cosine zenith angle)
  - This also allows smoother variation of ground variables and fluxes (eliminates steps in time series)
- Diffuse, direct, and direct normal shortwave components are now output (`swddir`, `swddif`, `swddni`)

# Surface schemes

Surface layer of atmosphere diagnostics  
(exchange/transfer coeffs)

Land Surface: Soil temperature /moisture /  
snow prediction /sea-ice temperature

# Surface Physics Components

# Surface Fluxes

- Heat, moisture and momentum

$$H = \rho c_p u_* \theta_* \quad E = \rho u_* q_* \quad \tau = \rho u_* u_*$$

$$u_* = \frac{k V_r}{\ln(z_r / z_0) - \psi_m} \quad \theta_* = \frac{k \Delta \theta}{\ln(z_r / z_{0h}) - \psi_h} \quad q_* = \frac{k \Delta q}{\ln(z_r / z_{0q}) - \psi_h}$$

Subscript  $r$  is reference level (lowest model level, or 2 m or 10 m)

$\Delta$  refers to difference between surface and reference level value

$z_0$  are the roughness lengths

$k$  is the von Karman constant (0.4)

# Roughness Lengths

- Roughness lengths are a measure of the “initial” length scale of surface eddies, and generally differ for velocity and scalars
- Roughness length depends on land-use type
- Some schemes use smaller roughness length for heat than for momentum
- For water points roughness length is a function of surface wind speed

# Exchange Coefficient

- $C_{hs}$  is the exchange coefficient for heat, defined such that

$$H = \rho c_p C_{hs} \Delta \theta$$

It is related to the roughness length, stability function and  $u^*$  by

$$C_{hs} = \frac{ku_*}{\ln\left(\frac{z}{z_0}\right) - \psi_h}$$

# WRF Surface Layer Options (sf\_sfclay\_physics)

- Use similarity theory to determine exchange coefficients and diagnostics of 2m T and q and 10 m winds
- Provide exchange coefficient to land-surface models
- Provide friction velocity to PBL scheme
- Provide surface fluxes over water points
- Schemes have variations in stability functions, roughness lengths

# Hurricane Options

- Ocean Mixed Layer Model (sf\_ocean\_physics=1)
  - 1-d slab ocean mixed layer (specified initial depth)
  - Includes wind-driven ocean mixing for SST cooling feedback
- 3d PWP ocean (Price et al.) (sf\_ocean\_physics=2)
  - 3-d multi-layer (~100) ocean, salinity effects
  - Fixed depth
- Alternative surface-layer options for high-wind ocean surface (isftcflx=1,2)
  - Use with sf\_sfclay\_physics=1
  - Modifies Charnock relation to give less surface friction at high winds (lower Cd)
  - Modifies surface enthalpy (Ck, heat/moisture) either with constant z0q (isftcflx=1), Garratt formulation (option 2)

# Fractional Sea Ice

- `fractional_seaice=1` - with input sea-ice fraction data can partition land/water fluxes within a grid box

# WRF Land-Surface Model Options (sf\_surface\_physics)

- Simple 5-layer soil model
  - No vegetation or snow cover prediction, just thermal diffusion in soil layers
- Noah LSM, RUC LSM, PX LSM land-surface models
  - Sophisticated vegetation model and snow cover prediction

## Illustration of Surface Processes

# Land-Surface Model Processes

# Land-Surface Model

- Predicts soil temperature and soil moisture in layers (4 for Noah and NoahMP, 6 for RUC, 2 for PX and 3 for SSiB)
- Predicts snow water equivalent on ground. May be in layers (NoahMP, RUC, SSiB)
- May predict canopy moisture only (Noah, NoahMP, RUC) or temperature only (SSiB)

# Land-Surface Options

- 5-layer thermal diffusion
- Noah LSM
- RUC LSM
- Pleim-Xiu LSM
- NoahMP (new in V3.4)
- SSiB (new in V3.4)
- CLM4 (new in V3.5)

# Vegetation and Soil

- Processes include evapotranspiration, root zone and leaf effects
- Vegetation fraction varies seasonally
- Considers vegetation categories (e.g. cropland, forest types, etc.)
- Considers soil categories (e.g. sandy, clay, etc.) for drainage and thermal conductivity

# Snow Cover

- LSMs include fractional snow cover and predict snow water equivalent development based on precipitation, sublimation, melting and run-off
  - Single-layer snow (Noah, PX)
  - Multi-layer snow (RUC, NoahMP, SSiB,CLM4)
  - 5-layer option has no snow prediction
- Frozen soil water also predicted (Noah, NoahMP, RUC)

# Urban Effects

- Urban category in LSM is usually adequate for larger-scale studies
- Or can use an urban model (sf\_urban\_physics) with Noah LSM
  - Urban Canopy Model
  - Building Environment Parameterization (multi-layer model)
  - Building Energy Model (adds heating/AC effects to BEP)

# WRF-Hydro

- New in V3.5
- Coupling to hydrological model available
- Streamflow prediction, etc.
- Sub-grid tiling to ~100 m grid

# LSM Tables

- Properties can be changed in text files (tables)
- VEGPARM.TBL used by Noah and RUC for vegetation category properties
- SOILPARM.TBL used by Noah and RUC for soil properties
- LANDUSE.TBL used by 5-layer model
- URBPARM.TBL used by urban models

# Initializing LSMs

- Noah and RUC LSM require additional fields for initialization
  - Soil temperature
  - Soil moisture
  - Snow liquid equivalent
- These are in the Grib files, but are not from observations
- They come from “offline” models driven by observations (rainfall, radiation, surface temperature, humidity wind)

# Initializing LSMs

- There are consistent model-derived datasets for Noah and RUC LSMs
  - Eta/GFS/AGRMET/NNRP for Noah (although some have limited soil levels available)
  - RUC for RUC
- But, resolution of mesoscale land-use means there will be inconsistency in elevation, soil type and vegetation
- The only adjustment for soil temperature (done in real.exe) is for elevation differences between the original elevation and model elevation (SOILHGT used)
- Inconsistency leads to spin-up as adjustments occur in soil temperature and moisture at the beginning of the simulation
- This spin-up can only be avoided by running offline model on the same grid (e.g. HRLDAS for Noah) – may take months to spin up soil moisture
- Cycling land state between forecasts also helps, but may propagate errors (e.g. in rainfall effect on soil moisture)

ARW only

# sst\_update=1

Reads lower boundary file periodically to update the sea-surface temperature (otherwise it is fixed with time)

- For long-period simulations (a week or more)
- wrflowinp\_d0n created by *real*
- Sea-ice can be updated since Version 3.0
- Vegetation fraction update is included
  - Allows seasonal change in albedo, emissivity, roughness length in Noah LSM
- usemonalb=.true. to use monthly albedo input

# Regional Climate Options

- `tmn_update=1` - updates deep-soil temperature for multi-year future-climate runs
- `sst_skin=1` - adds diurnal cycle to sea-surface temperature
- `bucket_mm` and `bucket_J` - a more accurate way to accumulate water and energy for long-run budgets (see later)
- `output_diagnostics=1` (added in 3.3.1) – ability to output max/min/mean/std of surface fields in a specified period

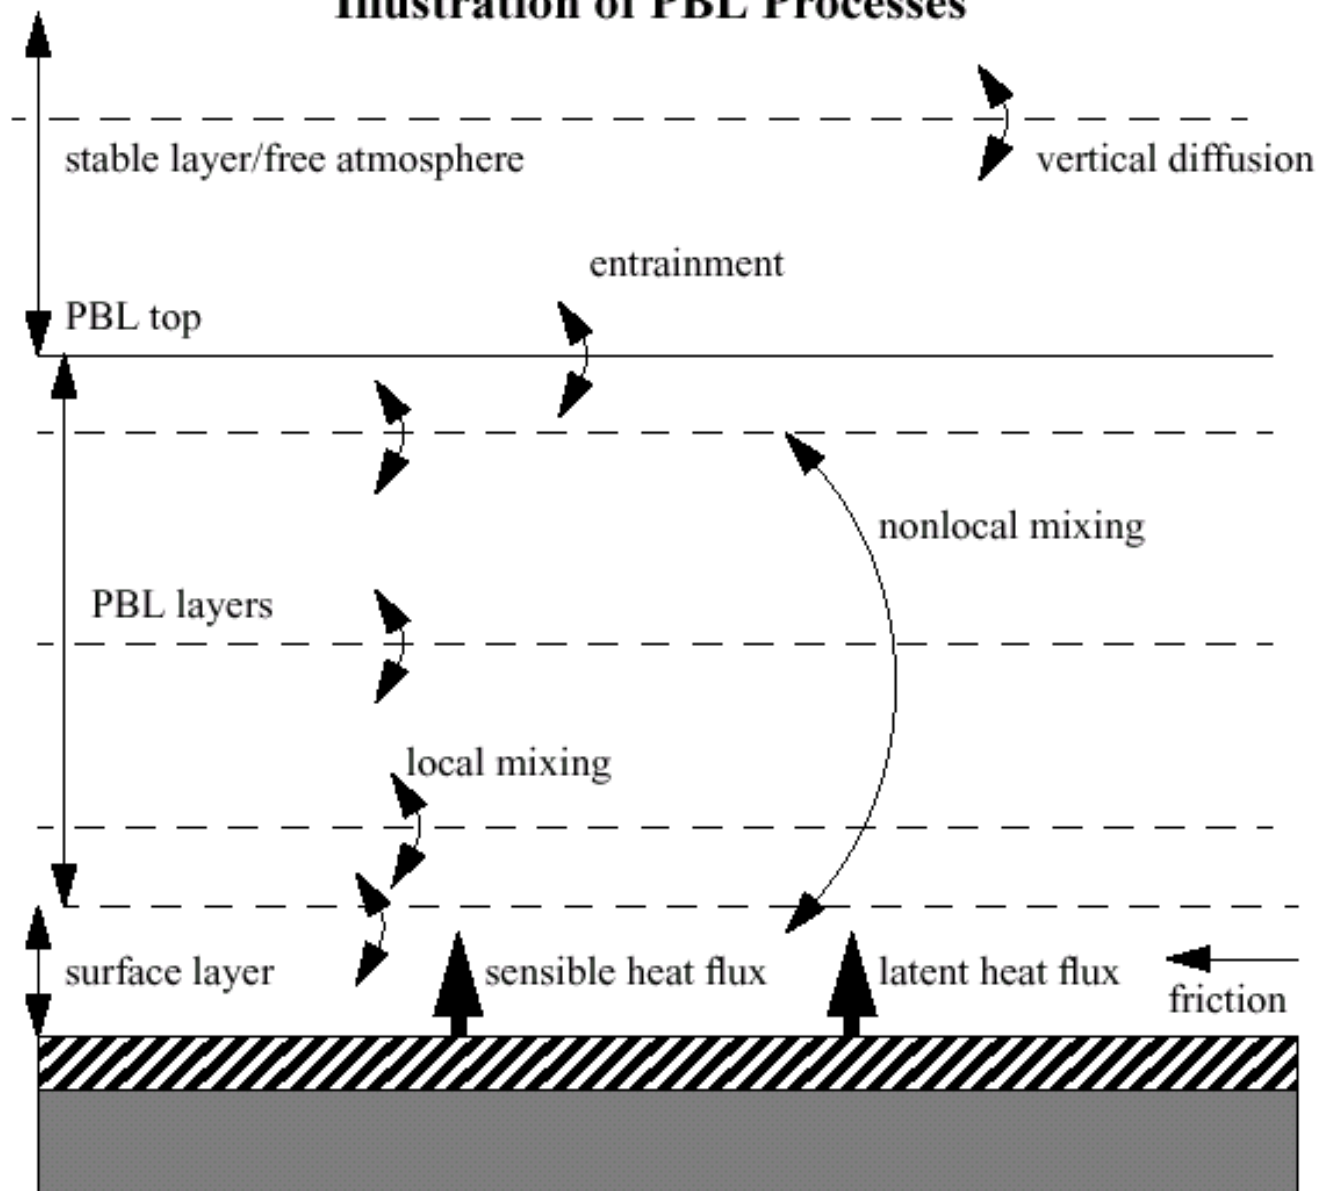

# Planetary Boundary Layer

Provides

Boundary layer fluxes (heat, moisture,  
momentum)

Vertical diffusion in whole column

## Illustration of PBL Processes

# Planetary Boundary Layer

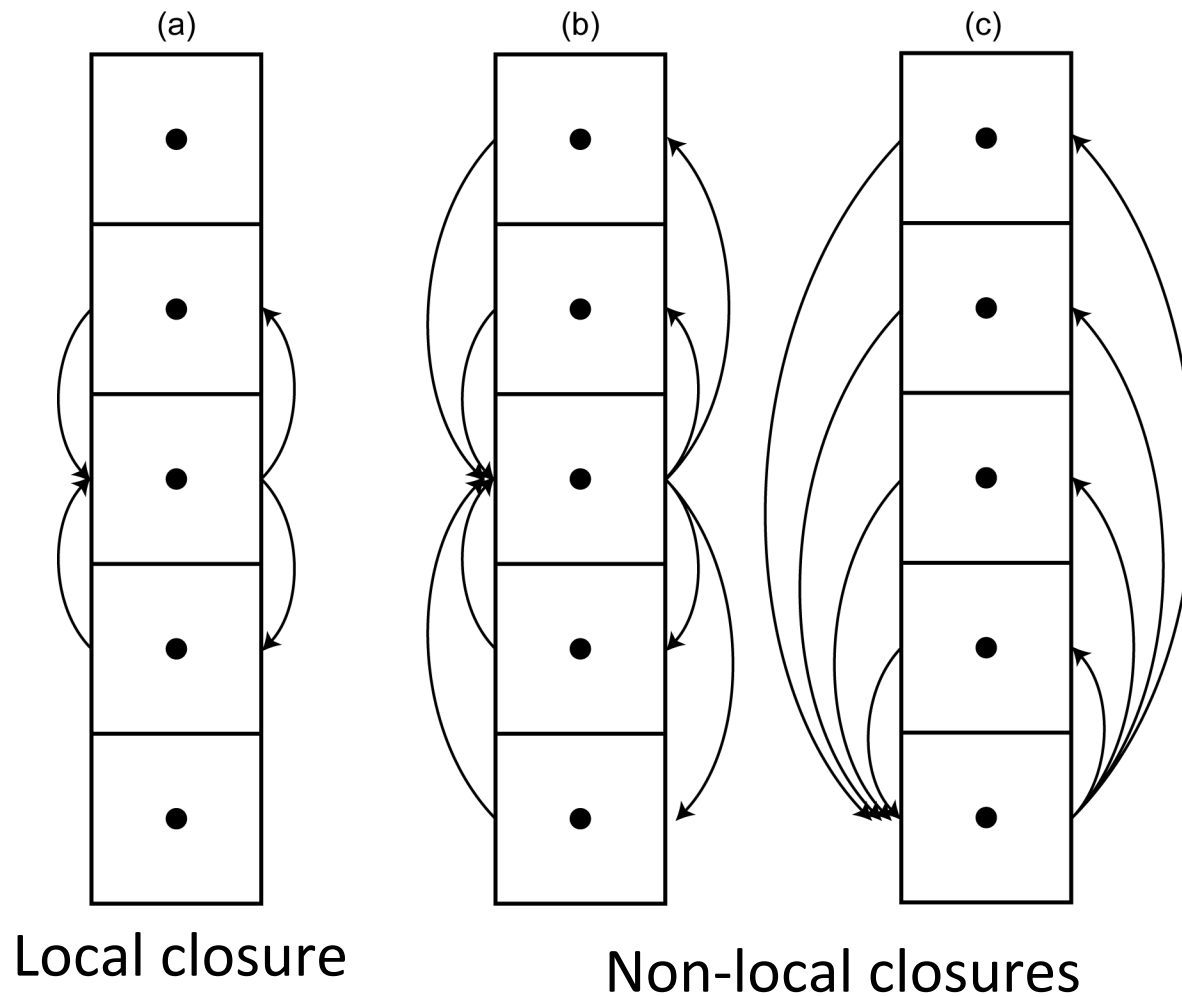

# WRF PBL Options (bl\_pbl\_physics)

- Purpose is to distribute surface fluxes with boundary layer eddy fluxes and allow for PBL growth by entrainment
- Classes of PBL scheme
  - Turbulent kinetic energy prediction (Mellor-Yamada Janjic, MYNN, Bougeault-Lacarrere, TEMF, QNSE, CAM UW)
  - Diagnostic non-local (YSU, GFS, MRF, ACM2)
- Above PBL all these schemes also do vertical diffusion due to turbulence

# PBL schemes in V3.5

bl_pbl_physics	Scheme	Reference	Added
1	YSU	Hong, Noh and Dudhia (2006, MWR)	2004
2	MYJ	Janjic (1994, MWR)	2000
3	GFS	Hong and Pan (1996, MWR)	2005

94	QNSE	Sukoriansky, Galperin and Perov (2005, BLM)	2009
99	MRF	Hong and Pan (1996, MWR)	2000

# Different approaches

# TKE schemes

- Solve for TKE in each column
  - Buoyancy and shear production
  - Dissipation
  - Vertical mixing
- TKE and length-scale are used to determine the  $K_v$  for local vertical mixing
- Schemes differ most in diagnostic length-scale computations

$$\frac{\partial}{\partial z} K_v \frac{\partial}{\partial z} \theta$$

# Nonlocal Schemes

- Diagnose a PBL top (either stability profile or Richardson number)

$$\frac{\partial}{\partial z} K_v \left( \frac{\partial}{\partial z} \theta + \Gamma \right)$$

- Specify a K profile
- YSU, MRF, GFS include a non-gradient term ( $\Gamma$ )
- ACM2, TEMF, EDMF include a mass-flux profile,  $M$ , which is an additional updraft flux

$$\frac{\partial}{\partial z} \left( K_v \frac{\partial}{\partial z} \theta + M(\theta_u - \theta) \right)$$

# Vertical Mixing Coefficient

- Several schemes also output `exch_h` which is  $K_v$  for scalars that is used by WRF-Chem
- WRF in the future will also use this for scalar and tracer vertical mixing outside the PBL scheme since these arrays are currently only advected and horizontally mixed when using a PBL scheme
- PBL schemes themselves only mix limited variables: momentum, heat, vapor and some specific cloud variables

# PBL schemes in V3.5

bl_pbl_physics	Scheme	Cores	sf_sfclay_physics	Prognostic variables	Diagnostic variables	Cloud mixing

99	MRF	ARW NMM	1			QC,QI

# PBL Scheme Options

PBL schemes can be used for most grid sizes when surface fluxes are present

- Lowest level should be in the surface layer (0.1h)
  - Important for surface (2m, 10m) diagnostic interpolation
- With ACM2, GFS and MRF PBL schemes, lowest full level should be .99 or .995 not too close to 1
- TKE schemes can use thinner surface layers
- Assumes that PBL eddies are not resolved
- At grid size  $dx \ll 1$  km, this assumption breaks down
  - Can use 3d diffusion instead of a PBL scheme in Version 3 (coupled to surface physics)
  - Works best when  $dx$  and  $dz$  are comparable

# Large-Eddy Simulation

- For grid sizes of up to about 100 m, LES is preferable
- LES treats turbulence three-dimensionally instead of separate vertical (PBL) and horizontal diffusion schemes
- TKE and 3d Smagorinsky options exist for the sub-grid turbulence

# Large-Eddy Simulation

- To run LES mode
  - Use `bl_pbl_physics=0` and `diff_opt=2` with `km_opt=2` or `3`
  - This scheme can also use real surface fluxes from the surface physics (heat, moisture, momentum stress) or idealized constant values

# LES schemes

Unified horizontal and vertical mixing (for  $dx \sim dz$ ).

Typically needed for  $dx < \sim 200$  m. Also use `mix_isotropic=1`.

bl_pbl_physics	diff_opt	km_opt	Scheme	Cores	sf_sfclay_physics	isfflx	Prognostic variables
0	2	2	tke	ARW	0,1,2	0,1,2	tke
0	2	3	3d Smagorinsky	ARW	0,1,2	0,1,2	

## Namelist isfflx controls surface flux methods

isfflx	sf_sfclay_physics	Heat flux	Drag	Real/Ideal
0	0	From namelist tke_heat_flux	From namelist tke_drag_coefficient	Ideal
1	1,2	From LSM/sfclay physics (HFX, QFX)	From sfclay physics (UST)	Real
2	1,2	From namelist tke_heat_flux	From sfclay physics (UST)	Ideal

# Other Options

- Gravity-wave drag can be added for low resolution ( $> 10$  km) runs to represent sub-grid orographic gravity-wave vertical momentum transport (gwd\_opt=1)
- Wind-farm model has been added to investigate wind-farm effects on the environment (extra stress and turbulence generation)
- topo\_wind=1: Jimenez and Dudhia 10 m wind bias correction method for terrain effects

# topo\_wind=1,2

- 1: Jimenez and Dudhia (2012), 2: Mass and Ovens
- Correction for effects on 10m wind of
  - Sub-grid topography (extra friction)
    - Uses sub-grid variance from geogrid (new)
  - Hill-tops (reduced friction) (option 1 only)
    - Uses Laplacian of resolved elevation
- This reduces 10 m wind biases
- Designed for high resolution ~2 km
- Only implemented in YSU PBL (bl\_pbl\_physics=1)

ARW only

# bldt

- Minutes between boundary layer/LSM calls
- Typical value is 0 (every step)

# Turbulence/Diffusion

Sub-grid eddy mixing effects on all  
fields, e.g.

$$\frac{\partial}{\partial x} K_h \frac{\partial}{\partial x} \theta + \frac{\partial}{\partial y} K_h \frac{\partial}{\partial y} \theta + \frac{\partial}{\partial z} K_v \frac{\partial}{\partial z} \theta$$

# Difference between diff\_opt 1 and 2

diff\_opt=1

Horizontal diffusion acts along model levels

Simpler numerical method with only neighboring points on the same model level

# Difference between diff\_opt 1 and 2

diff\_opt=2

Horizontal diffusion acts on horizontal gradients

Numerical method includes vertical correction term  
using more grid points

ARW only

# km\_opt

- km\_opt selects method for computing K coefficient
  - km\_opt=1: constant (use khdif and kvdif to specify – idealized)
  - km\_opt=2: 3d tke prediction used to compute K (requires diff\_opt=2)
  - km\_opt=3: 3d Smagorinsky diagnostic K (requires diff\_opt=2)
  - km\_opt=4: 2d Smagorinsky for horizontal K (to be used with PBL or kvdif for vertical K )

ARW only

# sfs\_opt

- Sub-filter-scale stress model for LES applications impacting momentum mixing (Kosovic, Mirocha)
  - sfs\_opt=0 (default) off
  - sfs\_opt=1 Nonlinear Backscatter and Anisotropy (NBA) option 1: using diagnostic stress terms (km\_opt=2,3)
  - sfs\_opt=2 NBA option 2: using tke-based stress terms (km\_opt=2 only)
  - Also m\_opt=1 for added outputs of SGS stresses

# Diffusion Option Choice

- Real-data case with PBL physics on
  - Best is `diff_opt=1`, `km_opt=4`
  - From V3.6 `diff_opt=2` can be used with `km_opt=4` (was unstable with complex terrain before so not recommended)
  - This complements vertical diffusion done by PBL scheme
- High-resolution real-data cases (~100 m grid)
  - No PBL
  - `diff_opt=2`; `km_opt=2,3` (tke or Smagorinsky scheme)
- Idealized cloud-resolving ( $dx = 1-3$  km) modeling (smooth or no topography, no surface heat fluxes)
  - `diff_opt=2`; `km_opt=2,3`
- Complex topography with no PBL scheme
  - `diff_opt=2` is more accurate for sloped coordinate surfaces, and prevents diffusion up/down valley sides but sometimes unstable with complex terrain
- Note: WRF can run with no diffusion (`diff_opt=0`)

ARW only

# diff\_6th\_opt

- 6<sup>th</sup> order optional added horizontal diffusion on model levels
  - Used as a numerical filter for  $2 \cdot dx$  noise
  - Suitable for idealized and real-data cases
  - Affects all advected variables including scalars
- diff\_6th\_opt
  - 0: none (default)
  - 1: on (can produce negative water)
  - 2: on and prohibit up-gradient diffusion (better for water conservation)
- diff\_6th\_factor
  - Non-dimensional strength (typical value 0.12, 1.0 corresponds to complete removal of  $2 \cdot dx$  wave in a time-step)

# Upper damping (damp\_opt)<sup>ARW only</sup>

Purpose is to prevent unrealistic reflections of waves from model top. Can be important over high topography.

## Options

- 1: Upper level diffusive layer
- 2: Rayleigh damping (idealized only – needs input sounding)
- 3: w-Rayleigh damping (damps w only)

## All options use

- Cosine function of height
- Additional parameters
  - zdamp: depth of damping layer
  - dampcoef: nondimensional maximum magnitude of damping

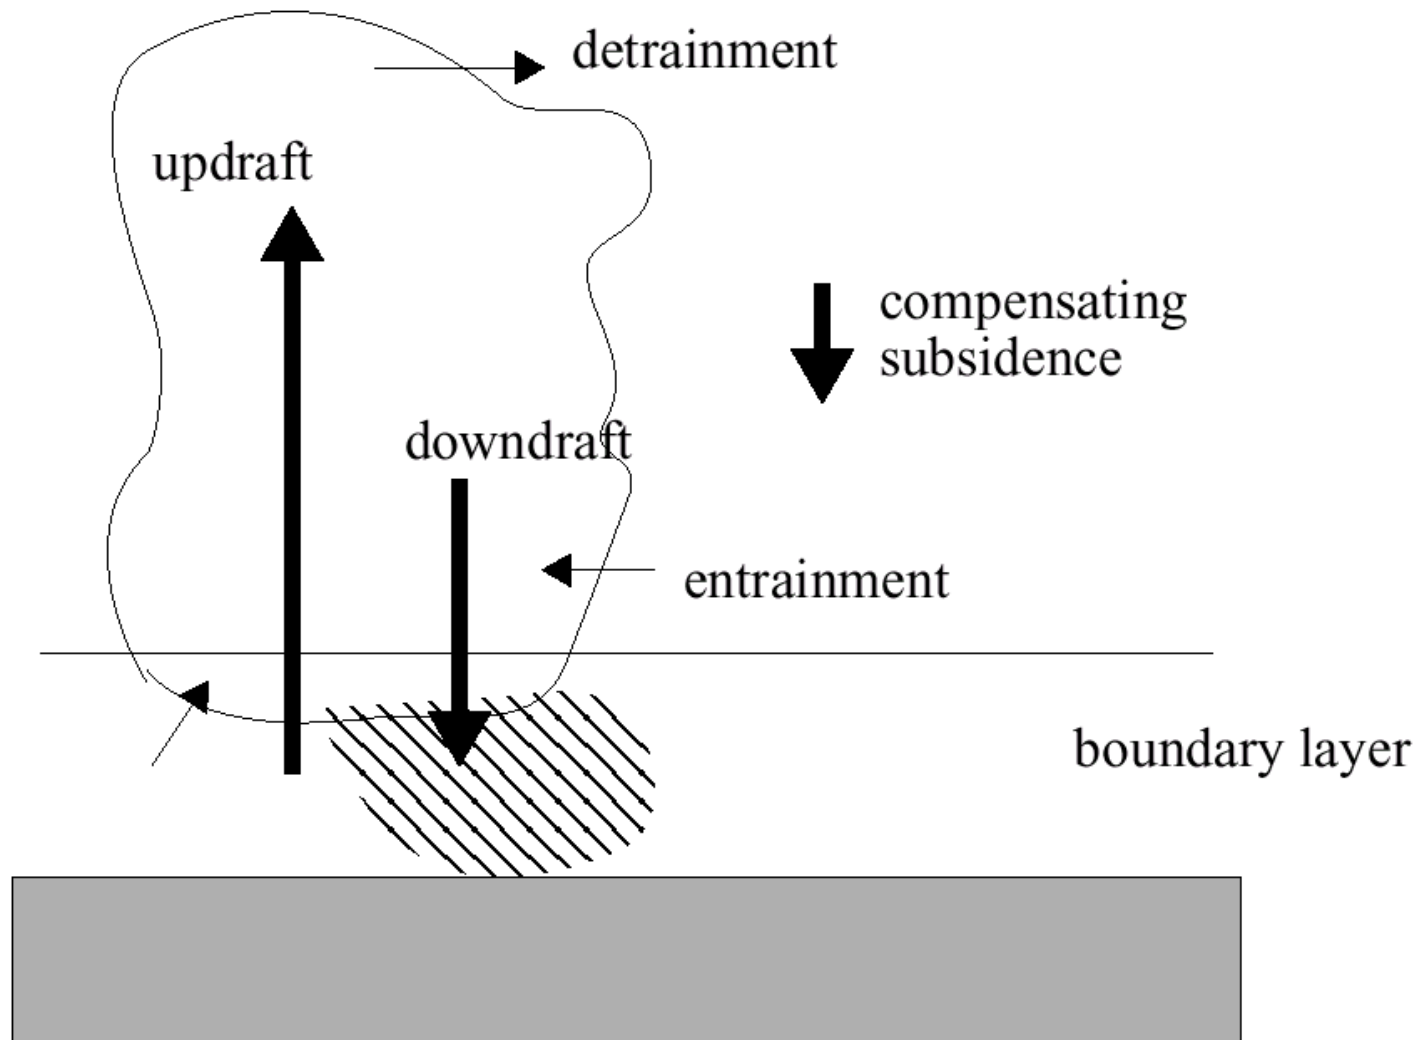

# Cumulus Parameterization

Provides

Atmospheric heat and moisture/cloud  
tendency profiles

Surface sub-grid-scale (convective) rainfall

## Illustration of Cumulus Processes

# Cumulus Schemes

- Use for grid columns that completely contain convective clouds
- Re-distribute air in column to account for vertical convective fluxes
  - Updrafts take boundary layer air upwards
  - Downdrafts take mid-level air downwards
- Schemes have to determine
  - When to trigger a convective column
  - How fast to make the convection act

# Deep Convection

- Schemes work in individual columns that are considered convectively unstable
- Mass-flux schemes transport surface air to top of cloud and include subsidence
- Subsidence around cloud warms and dries troposphere removing instability over time
- Additionally downdrafts may cool PBL

# Parameterizations of cumulus convection

# WRF Cumulus Parameterization Options

- Cumulus schemes fall into two main classes
  - Adjustment type (Betts-Miller-Janjic)
    - Relaxes towards a post-convective (mixed) sounding
  - Mass-flux type (all others in WRF)
    - Determines updraft (and often downdraft) mass flux and other fluxes (sometimes including momentum transport)

# Cumulus schemes in V3.5

99	Old Kain-Fritsch	Kain and Fritsch (1990, JAS; 1993 Meteo. Monogr.)	2000

# Triggers

- Clouds only activate in columns that meet certain criteria
  - Presence of some convective available potential energy (CAPE) in sounding
  - Not too much convective inhibition (CIN) in sounding (cap strength)
  - Minimum cloud depth from parcel ascent

# Closures

- Closure determine cloud strength (mass-flux) based on various methods
  - Clouds remove CAPE over time
    - Specified CAPE-removal time scale (KF, Tiedtke, ZM, BMJ)
    - Quasi-equilibrium (Arakawa-Schubert) with large-scale destabilization  $d(\text{CAPE})/dt$  (SAS, NSAS)
    - Column moisture convergence
    - Low-level large-scale ascent (mass convergence)

# Ensemble methods

- GF, G3 and GD use ensemble of triggers and closures possibly with with varying parameters (effectively up to 144 members)
- Take mean of ensemble to feed back to model
- In principle, can be tuned to emphasize various members under different conditions

# Shallow Convection

- Non-precipitating shallow mixing dries PBL, moistens and cools above
- This can be done by an enhanced mixing approach (SAS, GRIMS) or mass-flux approach (KF, NSAS, Tiedtke, G3, GF)
- May be useful at grid sizes that do not resolve shallow cumulus clouds ( $> 1$  km)

# Shallow Convection

- Cumulus schemes may include shallow convection (KF, SAS schemes, G3, GF, BMJ, Tiedtke)
- Standalone shallow schemes
  - UW Park-Bretherton (shcu\_physics=2)
  - GRIMS shallow scheme (shcu\_physics=3)
- Part of PBL schemes with mass-flux method
  - TEMF PBL option (bl\_bl\_physics=10)
  - QNSE-EDMF PBL (bl\_bl\_physics=4)

# Momentum Transport

- Some cumulus parameterizations also have momentum transport (SAS, NSAS, Tiedtke, ZM)
- Most schemes transport momentum as a passive scalar but ZM and NSAS include a convective pressure gradient term

# Cloud Detrainment

- Most schemes detrain cloud and ice at cloud top (except BMJ)
- KF schemes also detrain snow and rain
- These are then used by the microphysics

ARW only

# cudt

- Time between cumulus scheme calls
- Typical value is 5 minutes
  - Note: for KF scheme this is also used for averaging time for vertical velocity trigger
  - Not used by G3 or GD schemes

# Cumulus scheme

## Recommendations about use

- For  $dx \geq 10$  km: probably need cumulus scheme
- For  $dx \leq 3$  km: probably do not need scheme
  - However, there are cases where the earlier triggering of convection by cumulus schemes help
- For  $dx=3-10$  km, scale separation is a question
  - Few schemes are specifically designed with this range of scales in mind
  - G3 has an option to spread subsidence in neighboring columns
  - GF phases out deep convection at fine grid size
- Issues with 2-way nesting when physics differs across nest boundaries (seen in precip field on parent domain)
  - best to use same physics in both domains or 1-way nesting or make nested domain large enough to keep parent effects away from interior

# Microphysics

- Latent heat release from
  - Condensation, evaporation, deposition, sublimation, freezing, melting
- Particle types
  - Cloud water, rain drops, ice crystals, snow, graupel (also hail in some)
    - Total mass contributes to liquid loading in dynamics
- Processes
  - Aggregation, accretion, growth, fall-out

# Microphysics: Single and Double Moment Schemes

- Single-moment schemes have one prediction equation for mass ( $\text{kg/kg}$ ) per species ( $Q_r$ ,  $Q_s$ , etc.) with particle size distribution being derived from fixed parameters
- Double-moment (DM) schemes add a prediction equation for number concentration ( $\text{\#/kg}$ ) per DM species ( $N_r$ ,  $N_s$ , etc.)
- DM schemes may only be double-moment for a few species
- DM schemes allow for additional processes such as size-sorting during fall-out and sometimes aerosol (CCN) effects

# Microphysics: Fall terms

- Microphysics schemes handle fall terms for particles (usually everything except cloud water has a fall term)
- For long time-steps (such as mesoscale applications  $\Delta t \sim 60$  s,  $V_t = 5$  m/s), drops may fall more than a grid level in a time-step
- This requires splitting the time-step (most schemes) or lagrangian numerical methods (WSM and WDM schemes) to keep the scheme numerically stable

ARW only

# no\_mp\_heating=1

- Turn off heating effect of microphysics
  - Zeroes out the temperature tendency
  - Equivalent to no latent heat
  - Other microphysics processes not affected
  - Since Version 3.0

# Microphysics Options

## Recommendations about choice

- Probably not necessary to use a graupel scheme for  $dx > 10$  km
  - Updrafts producing graupel not resolved
  - Cheaper scheme may give similar results
- When resolving individual updrafts, graupel scheme should be used
- All domains use same option

# Rainfall Output

- Cumulus and microphysics can be run at the same time
- ARW outputs rainfall accumulations since simulation start time (0 hr) in mm
- RAINC comes from cumulus scheme
- RAINNC comes from microphysics scheme
- Total is RAINC+RAINNC
  - RAINNCV is time-step value
  - SNOWNC/SNOWNCV are snow sub-set of RAINC/RAINNCV (also GRAUPELNC, etc.)

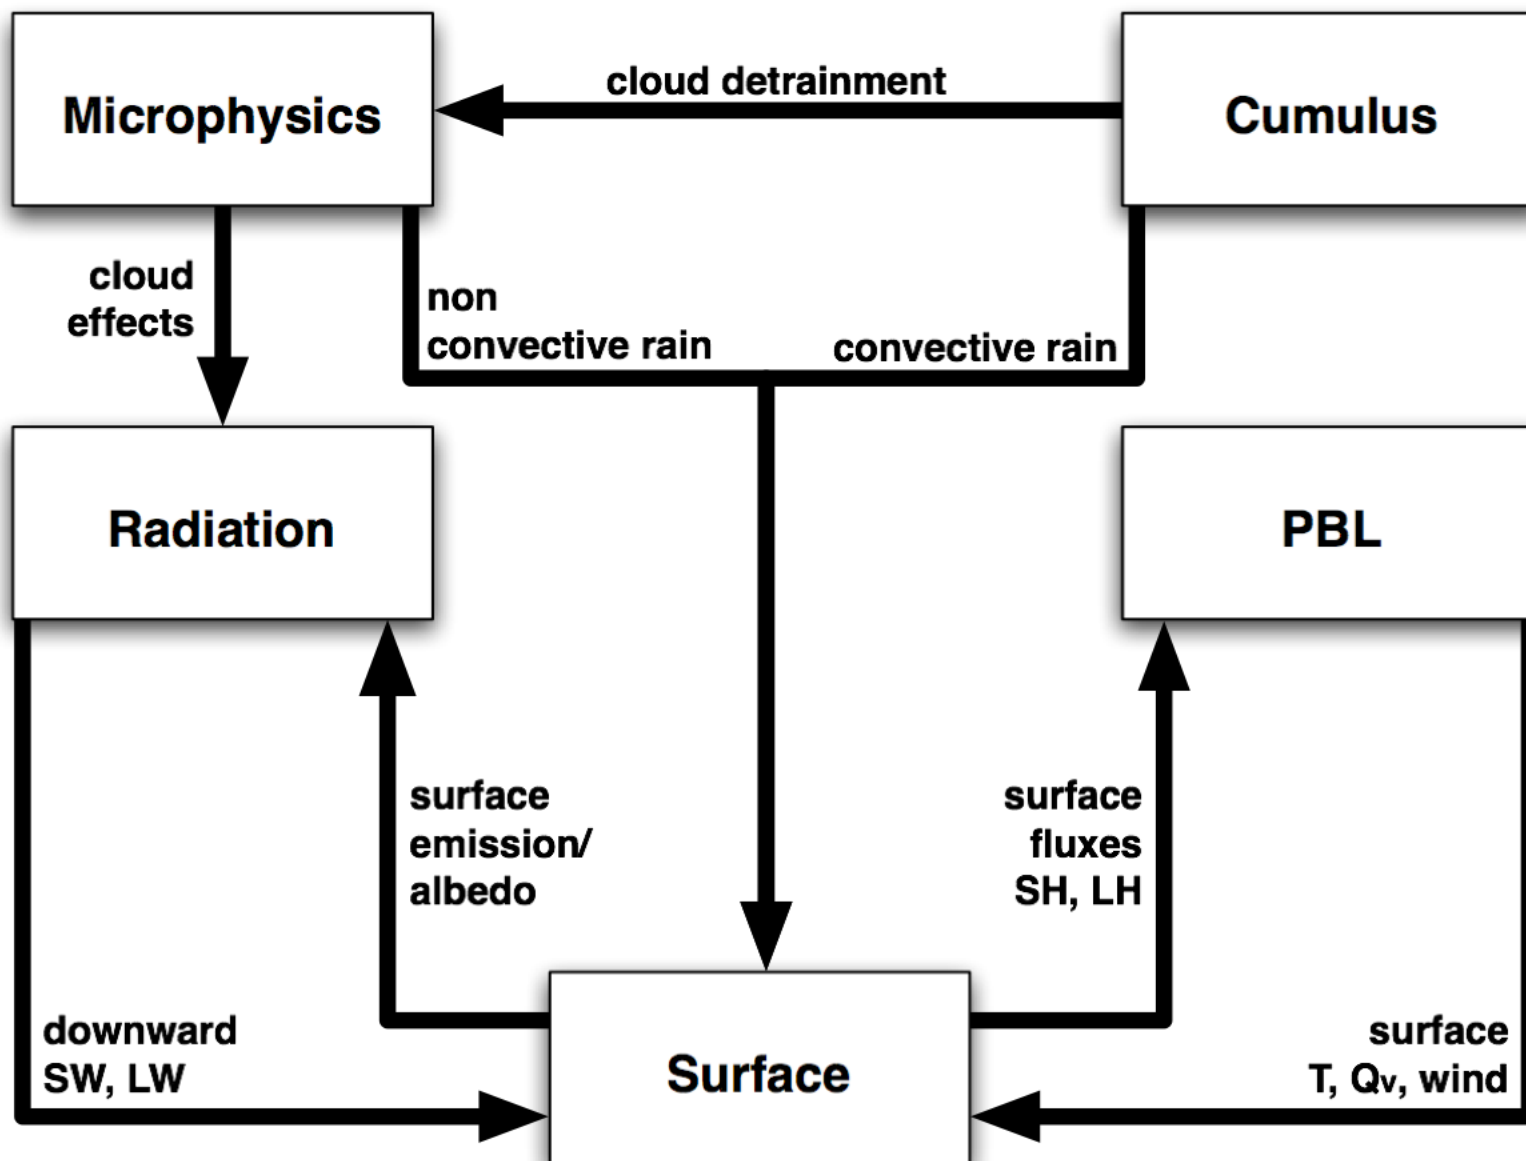

# Rainfall Output

## Options for “buckets”

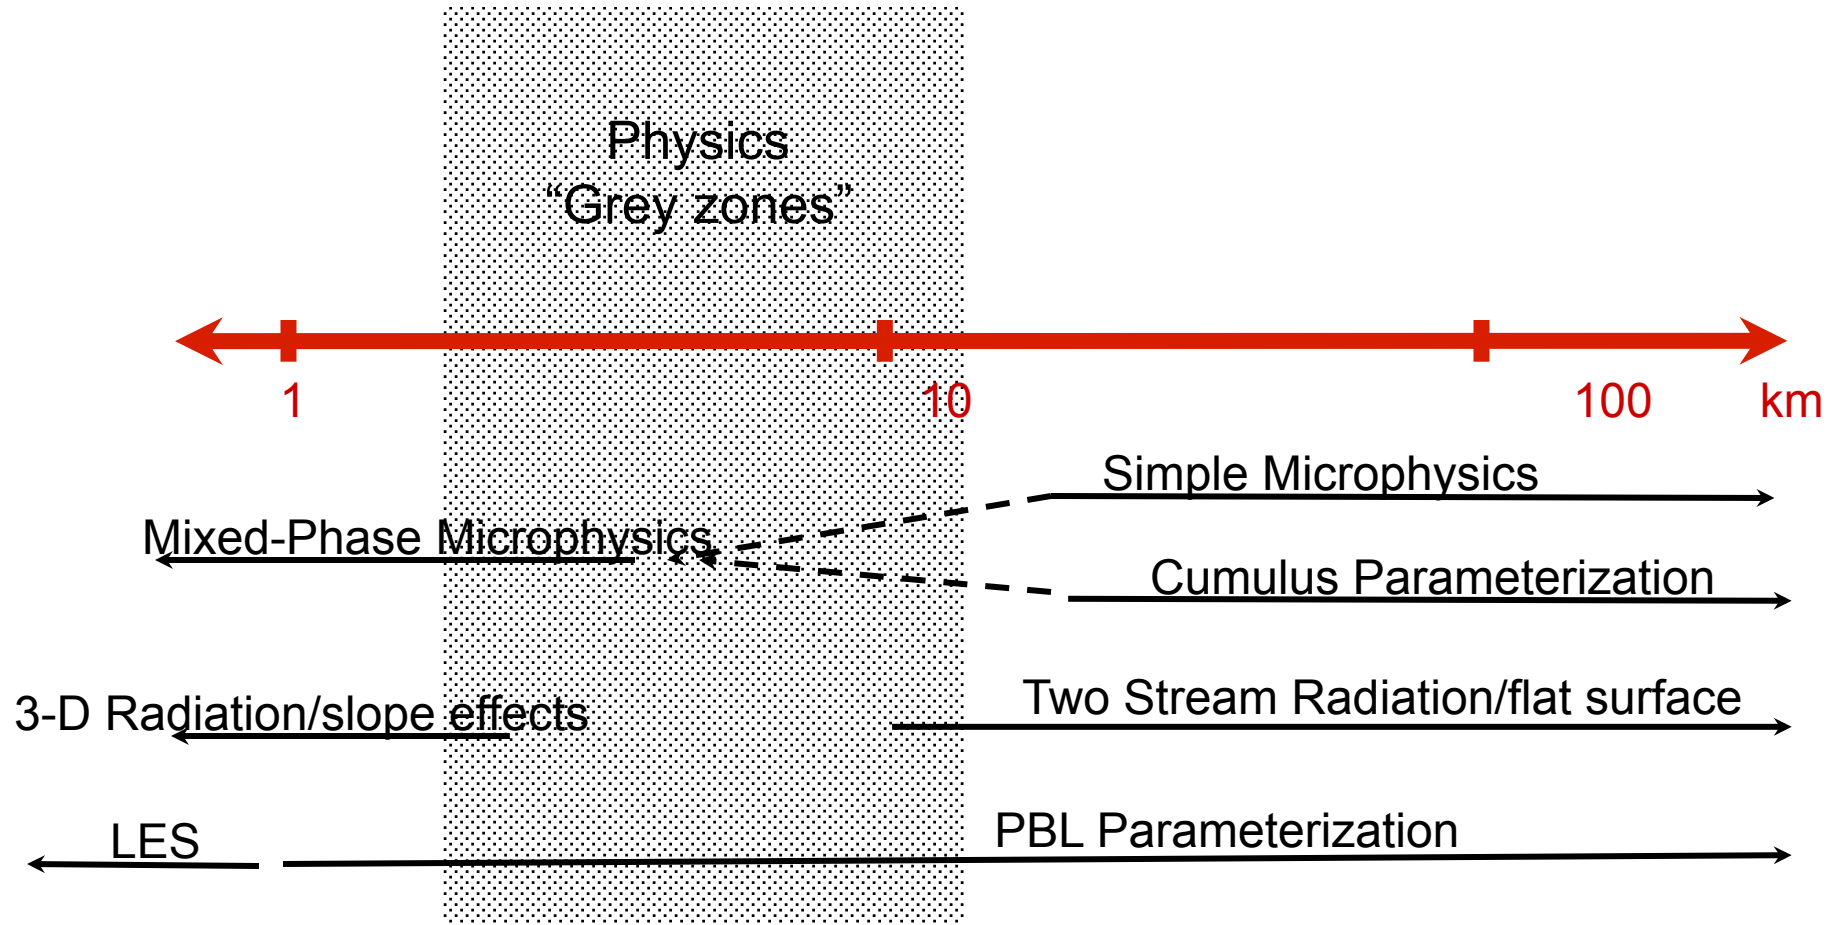

- `prec_acc_dt` (minutes) - accumulates separate `prec_acc_c`, `prec_acc_nc`, `snow_acc_nc` in each time window (we recommend `prec_acc_dt` is equal to the wrf output frequency to avoid confusion)
- `bucket_mm` - separates `RAIN(N)C` into `RAIN(N)C` and `I_RAIN(N)C` to allow accuracy with large totals such as in multi-year accumulations
  - $\text{Rain} = \text{I\_RAIN(N)C} * \text{bucket\_mm} + \text{RAIN(N)C}$
  - `bucket_mm` = 100 mm is a reasonable bucket value
  - `bucket_J` also for CAM and RRTMG radiation budget terms (1.e9 J/m<sup>2</sup> recommended)
