

NCAR

# WRF Four-Dimensional Data Assimilation (FDDA)

Jimy Dudhia

ARW only

## FDDA

- Method of nudging model towards observations or analysis
- May be used for
  - Dynamical initialization (pre-forecast period)
  - Creating 4D meteorological datasets (e.g. for air quality model)
  - Boundary conditions (outer domain nudged towards analysis)

# Method

- Model is run with extra nudging terms for horizontal winds, temperature and water vapor
- In analysis nudging, these terms nudge point-by-point to a 3d space- and time-interpolated analysis field
- In obs-nudging, points near observations are nudged based on model error at obs site
- The nudging is a relaxation term with a user-defined time scale around an hour or more
- Nudging will work with nesting and restarts

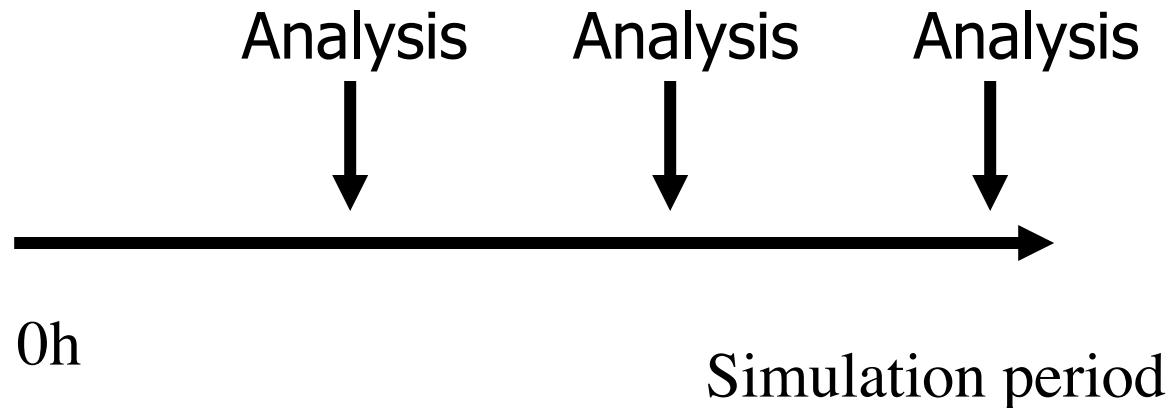

# Dynamic Initialization

- Model domains are nudged towards analysis in a pre-forecast period of 6-12 hours
- This has benefit of smooth start up at forecast time zero

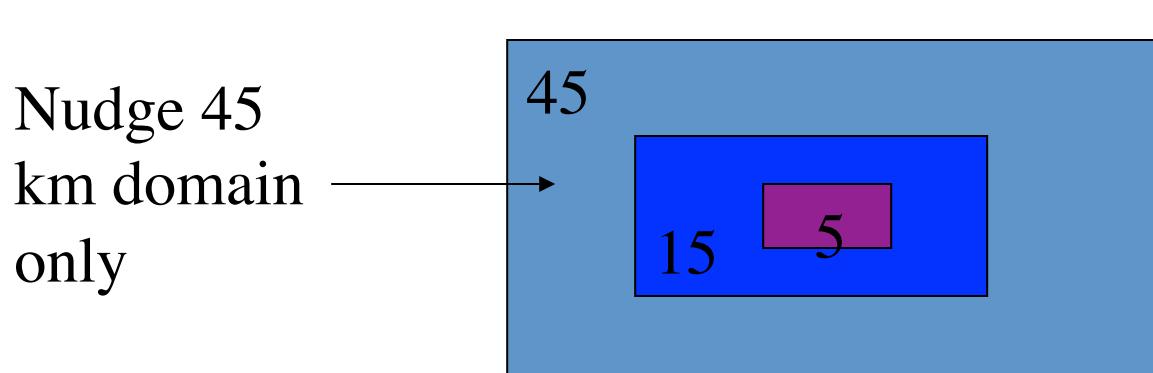

# Four-Dimensional Met Analysis

- Produces analyses between normal analysis times
- High-resolution balanced and mass-continuity winds can be output to drive off-line air quality models

# Boundary Conditions

- Nudge an outer domain towards analysis through forecast
- This has benefit of providing smoother boundary conditions to domain of interest than if 15 km domain is the outer domain with interpolated-analysis boundary conditions

# FDDA Methods

- Two Methods
  - Grid or analysis nudging (suitable for coarse resolution)
  - Observation or station nudging (suitable for fine-scale or asynoptic obs)
- Nudging can be applied to winds, temperature, and water vapor

**Note:** nudging terms are fake sources, so avoid FDDA use in dynamics or budget studies

# Analysis Nudging (grid\_fdda=1)

- Each grid-point is nudged towards a value that is time-interpolated from analyses

$$\frac{\partial p^* \alpha}{\partial t} = F(\alpha, \mathbf{x}, t) + G_\alpha \cdot W_\alpha \cdot \epsilon_\alpha(\mathbf{x}) \cdot p^*(\hat{\alpha}_0 - \alpha)$$

In WRF  $p^*$  is m and  $\alpha$  is  $u, v, T$  or  $q$

$F$  includes all the regular WRF terms

# Analysis Nudging

$$\frac{\partial p^* \alpha}{\partial t} = F(\alpha, \mathbf{x}, t) + G_\alpha \cdot W_\alpha \cdot \epsilon_\alpha(\mathbf{x}) \cdot p^*(\hat{\alpha}_0 - \alpha)$$

- $G$  is nudging inverse time scale
- $W$  is vertical weight (upper air and surface)
- $e$  is a horizontal weight for obs density (not implemented yet)

# Analysis Nudging

- 3d analysis nudging uses the WRF input fields at multiple times that are put in wrffdda\_d01 file by program real when run with grid\_fdda=1
  - With low time-resolution analyses, it is recommended not to use 3d grid-nudging in the boundary layer, especially for temperature
- Surface (2d) analysis nudging available in Version 3.1
  - Nudges surface and boundary layer only

# Analysis-Nudging namelist options

Can choose

- Frequency of nudging calculations (fgdt in minutes)
- Nudging time scale for each variable (guv, gt, gq in inverse seconds)
- Which variables not to nudge in the PBL  
(if\_no\_pbl\_nudging\_uv, etc.)
- Model level for each variable below which nudging is turned off (if\_zfac\_uv, k\_zfac\_uv, etc.)
- Ramping period over which nudging is turned off gradually (if\_ramping, dt\_ramp\_min)

# Surface Analysis Nudging

- In Version 3.1 added 2d (surface) nudging (`grid_fdda=1` and `grid_sfdda=1`) for surface analyses
  - `wrfsfdda_d01` file created by `obsgrid.exe`
  - Weights given by `guv_sfc`, `gt_sfc`, and `gq_sfc`
  - Note: `grid_fdda=1` must be used to activate this. If upper-air nudging not wanted, set upper weights `guv`, `gt`, `gq` =0.

# Spectral Nudging

- In Version 3.1 added spectral nudging (`grid_fdda=2`) to do 3d nudging of only selected larger scales
- This may be useful for controlling longer wave phases for long simulations. Compensates for error due to low-frequency narrow lateral boundaries
  - Top wavenumber nudged is selected in namelist (`xwavenum`, `ywavenum`, e.g. =3)
    - Typically choose so that  $(\text{domain size})/(\text{wavenumber})=\sim 1000 \text{ km}$  in each direction
  - Nudges  $u$ ,  $v$ ,  $\theta$ , geopotential (not  $q$ )
  - Can nudge in all levels or use ramp above a specified model level (`if_zfac_ph`, `k_zfac_ph`, `dk_zfac_ph`, etc.)

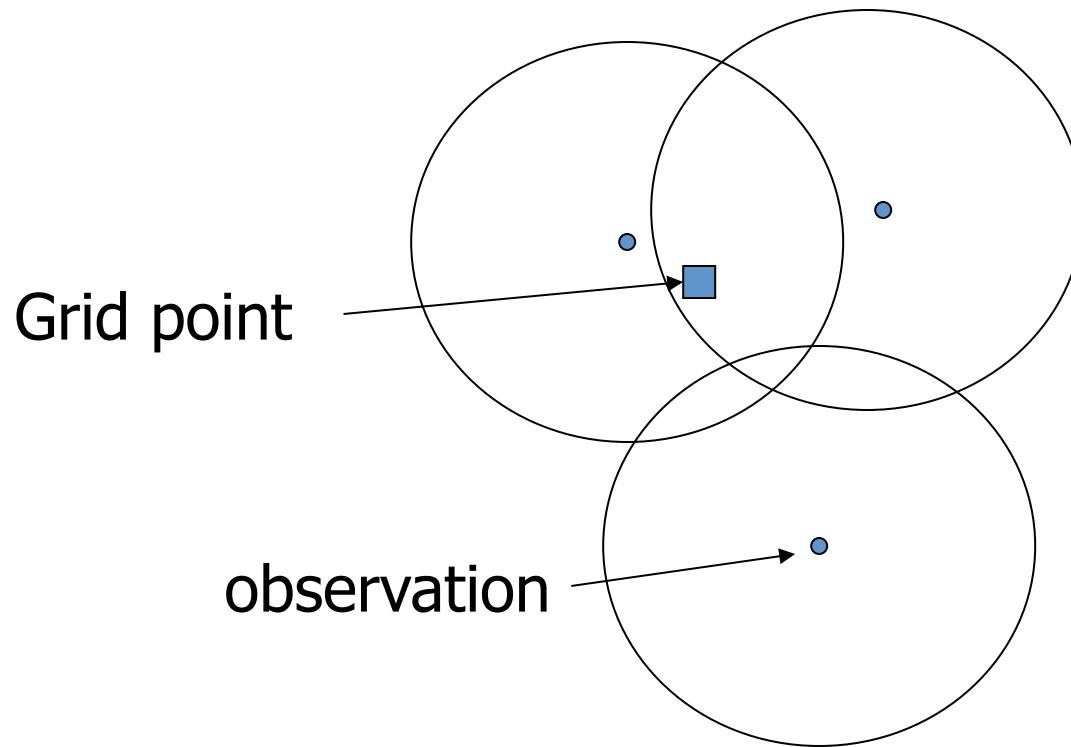

# Obs Nudging (obs\_nudge\_opt=1)

- Each grid point is nudged using a weighted average of differences from observations within a radius of influence and time window

$$\frac{\partial p^* \alpha}{\partial t} = F(\alpha, \mathbf{x}, t) + G_\alpha \cdot p^* \frac{\sum_{i=1}^N W_i^2(\mathbf{x}, t) \cdot \gamma_i \cdot (\alpha_o - \hat{\alpha})_i}{\sum_{i=1}^N W_i(\mathbf{x}, t)}$$

$$W(\mathbf{x}, t) = w_{xy} \cdot w_\sigma \cdot w_t$$

# Obs Nudging

Note: errors at obs sites are weighted by distance for nudging

# Obs Nudging

$$w_{xy} = \frac{R^2 - D^2}{R^2 + D^2} \quad 0 \leq D \leq R$$

$$w_{xy} = 0 \quad D > R,$$

- R is radius of influence
- D is distance from ob modified by elevation difference

# Obs Nudging

$$w_t = 1$$

$$|t - t_0| < \tau/2$$

$$w_t = \frac{\tau - |t - t_0|}{\tau/2}$$

$$\tau/2 \leq |t - t_0| \leq \tau$$

- $t$  is the specified time window for the obs
- This is a function that ramps up and down

# Obs Nudging

- $w_s$  is the vertical weighting – usually the vertical influence is set small (0.005 eta-difference) so that data is only assimilated on its own eta level
- obs input file is a special ascii file (OBS\_DOMAIN101) with obs sorted in chronological order
  - each record is the obs (u, v, T, Q) at a given model position and time
  - Utility programs exist to convert data to this format from other common formats
  - In V3.1 obsgrid.exe can create this file from standard observations that are in little\_r format

# Obs-Nudging namelist options

Can choose

- Frequency of nudging calculations (iobs\_ionf)
- Nudging time scale for each variable (obs\_coef\_wind, etc.)
- Horizontal and vertical radius of influence (obs\_rinxy, obs\_rinsig)
- Time window (obs\_twindo)
- Ramping period over which nudging is turned off gradually (obs\_idynin, obs\_dtramp)

# Vertical weighting functions

- Added flexibility options for advanced usage of obs-nudging with surface observations (switches in run/ README.namelist, e.g. `obsnudgezfullr1_uv`, etc.)
  - These allow specifying how variables are nudged in a profile with their full weight and/or ramp down function relative to the surface or PBL top in different regimes (stable or unstable).
  - Defaults are set to reasonable values, so these can be left out of namelist unless needed.

# FDDA Summary

- FDDA grid nudging is suitable for coarser grid sizes where analysis can be better than model-produced fields
- Obs nudging can be used to assimilate asynoptic or high-frequency observations
- Grid and obs nudging can be combined
- FDDA has fake sources and sinks and so should not be used on the domain of interest and in the time period of interest for scientific studies and simulations
