Cindy Bruyère

NCL

- NCAR Command Language
- <http://www.ncl.ucar.edu>
- Read WRF-ARW data directly
- Generate a number of graphical plots
 - Horizontal, cross-section, skewT, meteogram, panel
- Download
 - <http://www.ncl.ucar.edu/Download>
 - Fill out short registration form (*there is a short waiting period*)
 - Read and agree to OSI-based license
 - Get version 6 or *later* (current v6.2.0 – highly recommended)
- NCARG_ROOT environment variable
 - `setenv NCARG_ROOT /usr/local/ncl`

NCL & WRF

Home Directory

~/.hluresfile

Very Important

- Required by NCL libraries
- Must be in your “~/” directory (*home directory*)
- Control
 - color table ; font
 - white/black background
 - size of plot
 - control characters
- <http://www.ncl.ucar.edu/Document/Graphics/hlures.shtml>
- Less important in NCL version 6 and higher

~/.hluresfile

```

Generate Plots with NCL

- Set NCARG_ROOT environment variable:
 - `setenv NCARG_ROOT /usr/local/ncl`
- Ensure you have an `~/.hluresfile` file
- Create a script
 - `wrf_real.ncl`
(start with a sample script)
Most of the WRF script routines are called from
`"$NCARG_ROOT/lib/ncarg/nclscripts/wrf/WRFUserARW.ncl"`
Feel free to add or change this script
- Run NCL script
 - `ncl wrf_real.ncl`

Create line/shaded & vector plots
- **wrf_map_overlays / wrf_overlays**
Overlay plots created with wrf_contour and wrf_vector

NCL and Fortran/C Code

- Link Fortran/C Code to NCL scripts
 - Create a library from your Fortran/C code
 - Link to NCL script
- Link Low Level NCL (NCAR Graphics) to Fortran Code
 - Add calls to code inside Fortran code
 - Compile Fortran Code with NCL libraries
 - Example: WPS/utils/plotfmt.exe
 - *Older way or creating plots – not recommended*

Calling FORTRAN code from NCL

- Easier to use F77 code, but works with F90 code
- Need to isolate definition of input variables and wrap it with special comment statements:

```
C NCLFORTSTART  
C NCLEND
```

- Use a tool called **WRAPIT** to create a *.so file
- Load *.so file in NCL script with “**external**” statement
- Call Fortran function with special “::” syntax
- Must pre-allocate arrays!

myTK.f

C NCLFORTSTART

```
subroutine compute_tk (tk,pressure,theta, nx, ny, nz)
  implicit none
  integer nx,ny,nz
  real    pi, tk(nx,ny,nz)
  real    pressure(nx,ny,nz), theta(nx,ny,nz)
```

C NCLEND

```
  integer i,j,k

  do k=1,nz
    do j=1,ny
      do i=1,nx
        pi=(pressure(i,j,k) / 1000.)**(287./1004.)
        tk(i,j,k) = pi*theta(i,j,k)
      enddo
    enddo
  enddo

end
```

myTK.SO - Create & use in NCL script

```
% WRAPIT myTK.f
```

This will create a "myTK.so" file

```
load "$NCARG_ROOT/lib/ncarg/nclscripts/csm/gsn_code.ncl"
load "$NCARG_ROOT/lib/ncarg/nclscripts/wrf/WRFUserARW.ncl"
external myTK "./myTK.so"

begin
  t = wrf_user_getvar(a,"T",5)

  t = t + 300
  p = wrf_user_getvar(a,"pressure",5)

  ; Must preallocate space for output arrays
  dim = dimsizes(t)
  tk = new( dimsizes(t), typeof(t) )

  ; Remember, Fortran/NCL arrays are ordered differently
  myTK :: compute_tk (tk,p,t,dim(2),dim(1),dim(0))

end
```

FORTRAN 90 code

- Can use simple FORTRAN 90 code
- Your FORTRAN 90 program may not contain any of the following features:
 - pointers or structures as arguments,
 - missing/optional arguments,
 - keyword arguments, or
 - recursive procedure.
