

NCAR

Overview of WRF Physics

Jimmy Dudhia

NCAR/MMM

WRF Physics

- Radiation
 - Longwave (ra_lw_physics)
 - Shortwave (ra_sw_physics)
- Surface
 - Surface layer (sf_sfclay_physics)
 - Land/water surface (sf_surface_physics)
- PBL (bl_pbl_physics)
- Turbulence/Diffusion (diff_opt, km_opt)
- Cumulus parameterization (cu_physics)
- Microphysics (mp_physics)

Direct Interactions of Parameterizations

Radiation

Provides

Atmospheric temperature tendency
profile

Surface radiative fluxes

Illustration of Free Atmosphere Radiation Processes

WRF Longwave Radiation Schemes (ra_lw_physics)

- Compute clear-sky and cloud upward and downward radiation fluxes
 - Consider IR emission from layers
 - Surface emissivity based on land-type
 - Flux divergence leads to cooling in a layer
 - Downward flux at surface important in land energy budget
 - IR radiation generally leads to cooling in clear air ($\sim 2\text{K/day}$), stronger cooling at cloud tops and warming at cloud base

Longwave Radiation schemes

ra_lw_physics	Scheme	Reference	Added
1	RRTM	Mlawer et al. (1997, JGR)	2000
3	CAM	Collins et al. (2004, NCAR Tech. Note)	2006
4	RRTMG	Iacono et al. (2008, JGR)	2009
5	New Goddard	Chou and Suarez (2001, NASA Tech Memo)	2011
7	FLG (UCLA)	Gu et al. (2011, JGR), Fu and Liou (1992, JAS)	2012
31	Held-Suarez		2008
99	GFDL	Fels and Schwarzkopf (1981, JGR)	2004

Longwave Radiation in V3.7

ra_lw_physics	Scheme	Cores+Chem	Microphysics Interaction	Cloud Fraction	GHG
1	RRTM	ARW NMM	Qc Qr Qi Qs Qg	1/0	constant or yearly GHG
3	CAM	ARW	Qc Qi Qs	Max-rand overlap	yearly CO2 or GHG
4	RRTMG	ARW +Chem(τ)	Qc Qr Qi Qs	Max-rand overlap	constant or yearly GHG
5	New Goddard	ARW	Qc Qr Qi Qs Qg	1/0	constant
7	FLG (UCLA)	ARW	Qc Qr Qi Qs Qg	1/0	constant
31	Held-Suarez	ARW	none	none	none
99	GFDL	ARW NMM	Qc Qr Qi Qs	Max-rand overlap	constant

Clear Sky: IR-active Gases

- H₂O – from model prognostic vapor
- CO₂ – well-mixed, specified constant in whole atmosphere (CAM has yearly values)
 - For CAM, RRTM and RRTMG, GHG input file can update CO₂, N₂O and CH₄ (new in V3.5)
- O₃ – schemes have own climatologies
 - CAM has monthly, zonal, pressure-level data and RRTMG has this as an option (V3.5)
 - Others use single profiles (Goddard has 5 profiles to choose from)

Radiation effects in clear sky

shortwave

longwave

Spectral Bands

- Schemes divide IR spectrum into bands dominated by different absorption gases
- Typically 8-16 bands are used
- Computations use look-up tables for each band
 - Tables were generated from results of line-by-line calculations (LBLRTM models)

Clouds

- All schemes interact with resolved model cloud fields allowing for ice and water clouds and precipitating species
 - Only Thompson passes its own particle sizes to RRTMG radiation (since 3.5.1): other combinations only use mass info and assume effective sizes
- Clouds strongly affect IR at all wavelengths (considered “grey bodies”) and are almost opaque to it

Cloud Fractions

- Cloud fraction for microphysics clouds
 - icloud=1: Xu and Randall method
 - icloud=2: simple 1/0 method
 - lcloud=3: new Thompson option in V3.7
- Cloud fraction for unresolved convective clouds
 - cu_rad_feedback = .true.
 - Only works for GF, G3, GD and KF options
 - ZM separately provides cloud fraction to radiation

Cloud Fraction

- Overlap assumptions needed with multiple layers of varying fraction
 - Random overlap
 - Maximum overlap (clouds stacked as much as possible)
 - Maximum-random overlap (maximum for neighboring cloudy layers, random for layers separated by clear air)
- WRF schemes use max-random overlap

WRF Shortwave Radiation Options (ra_sw_physics)

- Compute clear-sky and cloudy solar fluxes
- Include annual and diurnal solar cycles
- Most schemes consider downward and upward (reflected) fluxes
 - Dudhia scheme only has downward flux
- Primarily a warming effect in clear sky
- Important component of surface energy balance

Shortwave Radiation schemes

ra_sw_physics	Scheme	Reference	Added
1	Dudhia	Dudhia (1989, JAS)	2000
2	Goddard	Chou and Suarez (1994, NASA Tech Memo)	2000
3	CAM	Collins et al. (2004, NCAR Tech Note)	2006
4	RRTMG	Iacono et al. (2008, JGR)	2009
5	New Goddard	Chou and Suarez (1999, NASA TM)	2011
7	FLG (UCLA)	Gu et al. (2011, JGR), Fu and Liou (1992, JAS)	2012
99	GFDL	Fels and Schwarzkopf (1981, JGR)	2004

Shortwave Radiation in V3.7

ra_lw_physics	Scheme	Cores+Chem	Microphysics Interaction	Cloud Fraction	Ozone
1	Dudhia	ARW NMM + Chem(PM2.5)	Qc Qr Qi Qs Qg	1/0	none
2	GSFC	ARW +Chem(τ)	Qc Qi	1/0	5 profiles
3	CAM	ARW	Qc Qi Qs	Max-rand overlap	Lat/month
4	RRTMG	ARW +Chem(τ), NMM	Qc Qr Qi Qs	Max-rand overlap	1 profile or lat/month
5	New Goddard	ARW	Qc Qr Qi Qs Qg	1/0	5 profiles
7	FLG (UCLA)	ARW	Qc Qr Qi Qs Qg	1/0	5 profiles
99	GFDL	ARW NMM	Qc Qr Qi Qs	Max-rand overlap	Lat/date

Clear Sky

- Main effect in troposphere is water vapor absorption (CO2 minor effect)
- Aerosols would be needed for additional scattering (WRF-Chem interacts with Goddard and RRTMG shortwave)
 - Dudhia scheme has tunable scattering
 - RRTMG has climatological aerosol input option (since V3.5)
 - aer_opt=1 (Tegen global monthly climatology)
 - aer_opt=2 user-specified properties and/or AOD map

Ozone

- Ozone heating maintains warm stratosphere
- Important for model tops above about 20 km (50 hPa)
- Usually specified from profiles as with longwave options
 - Dudhia scheme has no ozone effect
 - CAM, RRTMG have zonal climatology
- CAM, RRTMG, Goddard can also handle trace gases mainly N₂O and CH₄ (set constant)

Spectral Bands

- 11-19 spectral bands used by CAM, RRTMG and Goddard schemes
- Look-up tables

Clouds and Cloud Fraction

- Similar considerations to longwave
- Interacts with model resolved clouds and in some cases cumulus schemes
- Fraction and overlap assumptions
- Cloud albedo reflection
- Surface albedo reflection based on land-surface type and snow cover

Slope effects on shortwave

- In V3.2 available for all shortwave options
- Represents effect of slope on surface solar flux accounting for diffuse/direct effects
- slope_rad=1: activates slope effects - may be useful for complex topography and grid lengths < 2 km.
- topo_shading=1: shading of neighboring grids by mountains - may be useful for grid lengths < 1 km.

radt

Radiation time-step recommendation

- Radiation is too expensive to call every step
- Frequency should resolve cloud-cover changes with time
- $\text{radt}=1$ minute per km grid size is about right (e.g. $\text{radt}=10$ for $\text{dx}=10$ km)
- Each domain can have its own value but recommend using same value on all 2-way nests

Surface Shortwave Fluxes

New in V3.5.1 (for all shortwave options)

- `swint_opt=1` provides a smooth surface downward flux over time (interpolates using cosine zenith angle)
 - This also allows smoother variation of ground variables and fluxes (eliminates steps in time series)
- Diffuse, direct, and direct normal shortwave components are now output (`swddir`, `swddif`, `swddni`)

Surface schemes

Surface layer of atmosphere diagnostics
(exchange/transfer coeffs)

Land Surface: Soil temperature /moisture /
snow prediction /sea-ice temperature

Surface Physics Components

Surface Fluxes

- Heat, moisture and momentum

$$H = \rho c_p u_* \theta_* \quad E = \rho u_* q_* \quad \tau = \rho u_* u_*$$

$$u_* = \frac{k V_r}{\ln(z_r / z_0) - \psi_m} \quad \theta_* = \frac{k \Delta \theta}{\ln(z_r / z_{0h}) - \psi_h} \quad q_* = \frac{k \Delta q}{\ln(z_r / z_{0q}) - \psi_h}$$

Subscript r is reference level (lowest model level, or 2 m or 10 m)

Δ refers to difference between surface and reference level value

z_0 are the roughness lengths

k is the von Karman constant (0.4)

Roughness Lengths

- Roughness lengths are a measure of the “initial” length scale of surface eddies, and generally differ for velocity and scalars
- Roughness length depends on land-use type
- Some schemes use smaller roughness length for heat than for momentum
- For water points roughness length is a function of surface wind speed

Exchange Coefficient

- C_{hs} is the exchange coefficient for heat, defined such that

$$H = \rho c_p C_{hs} \Delta \theta$$

It is related to the roughness length, stability function and u^* by

$$C_{hs} = \frac{ku_*}{\ln\left(\frac{z}{z_0}\right) - \psi_h}$$

WRF Surface Layer Options (sf_sfclay_physics)

- Use similarity theory to determine exchange coefficients and diagnostics of 2m T and q and 10 m winds
- Provide exchange coefficient to land-surface models
- Provide friction velocity to PBL scheme
- Provide surface fluxes over water points
- Schemes have variations in stability functions, roughness lengths

Hurricane Options

- Ocean Mixed Layer Model (sf_ocean_physics=1)
 - 1-d slab ocean mixed layer (specified initial depth)
 - Includes wind-driven ocean mixing for SST cooling feedback
- 3d PWP ocean (Price et al.) (sf_ocean_physics=2)
 - 3-d multi-layer (~100) ocean, salinity effects
 - Fixed depth
- Alternative surface-layer options for high-wind ocean surface (isftcflx=1,2)
 - Use with sf_sfclay_physics=1
 - Modifies Charnock relation to give less surface friction at high winds (lower Cd)
 - Modifies surface enthalpy (Ck, heat/moisture) either with constant z0q (isftcflx=1), Garratt formulation (option 2)

Fractional Sea Ice

- `fractional_seaice=1` - with input sea-ice fraction data can partition land/water fluxes within a grid box
- Can be used with nearly all surface-layer schemes

WRF Land-Surface Model Options (sf_surface_physics)

- Simple 5-layer soil model
 - No vegetation or snow cover prediction, just thermal diffusion in soil layers
- Noah LSM, RUC LSM, PX LSM, CLM4 land-surface models
 - Sophisticated vegetation model and snow cover prediction

Illustration of Surface Processes

Land-Surface Model Processes

Land-Surface Model

- Driven by surface energy and water fluxes
- Predicts soil temperature and soil moisture in layers (4 for Noah and NoahMP, 6 for RUC, 2 for PX and 3 for SSiB)
- Predicts snow water equivalent on ground. May be in layers (NoahMP, RUC, SSiB)
- May predict canopy moisture only (Noah, RUC) or temperature only (SSiB) or both (NoahMP)

Land-Surface Options

- 5-layer thermal diffusion
- Noah LSM (also with mosaic option in V3.6)
- RUC LSM
- Pleim-Xiu LSM
- NoahMP (new in V3.4)
- SSiB (new in V3.4)
- CLM4 (new in V3.5)

Vegetation and Soil

- Processes include evapotranspiration, root zone and leaf effects
- Vegetation fraction varies seasonally
- Considers vegetation categories (e.g. cropland, forest types, etc.)
- Considers soil categories (e.g. sandy, clay, etc.) for drainage and thermal conductivity

Snow Cover

- LSMs include fractional snow cover and predict snow water equivalent development based on precipitation, sublimation, melting and run-off
 - Single-layer snow (Noah, PX)
 - Multi-layer snow (RUC, NoahMP, SSiB, CLM4)
 - 5-layer option has no snow prediction
- Frozen soil water also predicted (Noah, NoahMP, RUC)

Urban Effects

- Urban category in LSM is usually adequate for larger-scale studies
- Or can use an urban model (sf_urban_physics) with Noah LSM
 - Urban Canopy Model
 - Building Environment Parameterization (multi-layer model)
 - Building Energy Model (adds heating/AC to BEP)
 - NUDAPT detailed map data for 40+ US cities

LSM Tables

- Properties can be changed in text files (tables)
- VEGPARAM.TBL used by Noah and RUC for vegetation category properties
- SOILPARAM.TBL used by Noah and RUC for soil properties
- LANDUSE.TBL used by 5-layer model
- URBPARAM.TBL used by urban models

Initializing LSMs

- Noah and RUC LSM require additional fields for initialization
 - Soil temperature
 - Soil moisture
 - Snow liquid equivalent
- These are in the Grib files, but are not from observations
- They come from “offline” models driven by observations (rainfall, radiation, surface temperature, humidity wind)

Initializing LSMs

- There are consistent model-derived datasets for Noah and RUC LSMs
 - Eta/GFS/AGRMET/NNRP for Noah (although some have limited soil levels available)
 - RUC for RUC
- But, resolution of mesoscale land-use means there will be inconsistency in elevation, soil type and vegetation
- The only adjustment for soil temperature (done in real.exe) is for elevation differences between the original elevation and model elevation (SOILHGT used)
- Inconsistency leads to spin-up as adjustments occur in soil temperature and moisture at the beginning of the simulation
- This spin-up can only be avoided by running offline model on the same grid (e.g. HRLDAS for Noah) – may take months to spin up soil moisture
- Cycling land state between forecasts also helps, but may propagate errors (e.g. in rainfall effect on soil moisture)

ARW only

sst_update=1

Reads lower boundary file periodically to update the sea-surface temperature (otherwise it is fixed with time)

- For long-period simulations (a week or more)
- wrflowinp_d0n created by *real*
- Sea-ice can be updated since Version 3.0
- Vegetation fraction update is included
 - Allows seasonal change in albedo, emissivity, roughness length in Noah LSM
- usemonalb=.true. to use monthly albedo input

Regional Climate Options

- `tmn_update=1` - updates deep-soil temperature for multi-year future-climate runs
- `sst_skin=1` - adds diurnal cycle to sea-surface temperature
- `bucket_mm` and `bucket_J` - a more accurate way to accumulate water and energy for long-run budgets (see later)
- `output_diagnostics=1` (added in 3.3.1) – ability to output max/min/mean/std of surface fields in a specified period

Lake Model

- Added in V3.6 (from CLM climate physics)
- 10-layer lake model (sf_lake_physics=1)
- We have global bathymetry data for most large lakes (added from geogrid)
- Also can predict lake ice
- Can be used with any LSM
- Preprocessing allows diurnal averaging methods to initialize lake temperatures where not resolved by SST analysis

WRF-Hydro

- New in V3.5
- Coupling to hydrological model available
- Streamflow prediction, etc.
- Sub-grid tiling to ~100 m grid

Planetary Boundary Layer

Provides

Boundary layer fluxes (heat, moisture,
momentum)

Vertical diffusion in whole column

Illustration of PBL Processes

Planetary Boundary Layer

WRF PBL Options (bl_pbl_physics)

- Purpose is to distribute surface fluxes with boundary layer eddy fluxes and allow for PBL growth by entrainment
- Classes of PBL scheme
 - Turbulent kinetic energy prediction (Mellor-Yamada Janjic, MYNN, Bougeault-Lacarrere, TEMF, QNSE, CAM UW)
 - Diagnostic non-local (YSU, GFS, MRF, ACM2)
- Above PBL all these schemes also do vertical diffusion due to turbulence

PBL schemes in V3.7

bl_pbl_physics	Scheme	Reference	Added
1	YSU	Hong, Noh and Dudhia (2006, MWR)	2004
2	MYJ	Janjic (1994, MWR)	2000
3	GFS	Hong and Pan (1996, MWR)	2005
4	QNSE-EDMF	Sukoriansky, Galperin and Perov (2005, BLM), Pergaud, Masson, Malardel et al. (2009, BLM)	2012
5	MYNN2	Nakanishi and Niino (2006, BLM)	2009
6	MYNN3	Nakanishi and Niino (2006, BLM)	2009
7	ACM2	Pleim (2007, JAMC)	2008
8	BouLac	Bougeault and Lacarrere (1989, MWR)	2009
9	UW	Bretherton and Park (2009, JC)	2011
10	TEMF	Angevine, Jiang and Mauritsen (2010, MWR)	2011
11	SH	Shin and Hong (2014, MWR)	2015
12	GBM	Grenier and Bretherton (2001, MWR)	2013
99	MRF	Hong and Pan (1996, MWR)	2000

Different approaches

Local closure

Non-local closures

TKE schemes

- Solve for TKE in each column
 - Buoyancy and shear production
 - Dissipation
 - Vertical mixing
- TKE and length-scale are used to determine the K_v for local vertical mixing
- Schemes differ most in diagnostic length-scale computations

$$\frac{\partial}{\partial z} K_v \frac{\partial}{\partial z} \theta$$

Nonlocal Schemes

- Diagnose a PBL top (either stability profile or Richardson number)

$$\frac{\partial}{\partial z} K_v \left(\frac{\partial}{\partial z} \theta + \Gamma \right)$$

- Specify a K profile
- YSU, MRF, GFS include a non-gradient term (Γ)
- ACM2, TEMF, EDMF include a mass-flux profile, M , which is an additional updraft flux

$$\frac{\partial}{\partial z} \left(K_v \frac{\partial}{\partial z} \theta + M(\theta_u - \theta) \right)$$

Vertical Mixing Coefficient

- Several schemes also output `exch_h` which is K_v for scalars that is used by WRF-Chem
- WRF can now (V3.6) do scalar and tracer vertical mixing with PBL K-coefficients
 - `scalar_pblmix=1`, `tracer_pblmix=1`
- PBL schemes themselves only mix limited variables: momentum, heat, vapor and some specific cloud variables

PBL Schemes with Shallow Convection

- Some PBL schemes include shallow convection as part of their parameterization
- These use mass-flux approaches either
 - through the whole cloud-topped boundary layer (QNSE-EDMF and TEMF)
 - only from cloud base (GBM and UW PBL)
- YSU has top-down mixing option for turbulence driven by cloud-top radiative cooling which is separate from bottom-up surface-flux-driven mixing

PBL schemes in V3.7

bl_pbl_physics	Scheme	Cores	sf_sfclay_physics	Prognostic variables	Diagnostic variables	Cloud mixing
1	YSU	ARW NMM	1,91		exch_h	QC,QI
2	MYJ	ARW NMM	2	TKE_PBL	EL_PBL, exch_h	QC,QI
3	GFS(hwrf)	NMM	3			QC,QI
4	QNSE-EDMF	ARW NMM	4	TKE_PBL	EL_PBL, exch_h, exch_m	QC,QI
5	MYNN2	ARW	1,2,5,91	QKE	Tsq, Qsq, Cov, exch_h, exch_m	QC
6	MYNN3	ARW	1,2,5,91	QKE, Tsq, Qsq, Cov	exch_h, exch_m	QC
7	ACM2	ARW	1,7,91			QC,QI
8	BouLac	ARW	1,2,91	TKE_PBL	EL_PBL, exch_h, exch_m	QC
9	UW	ARW	1,2,91	TKE_PBL	exch_h, exch_m	QC
10	TEMF	ARW	10	TE_TEMF	*_temf	QC, QI
11	SH	ARW	1,91		Exch_h	QC, QI
12	GBM	ARW	1,91	TKE_PBL	EL_PBL,exch_h, exch_m	QC, QI
99	MRF	ARW NMM	1,91			QC,QI

PBL Scheme Options

PBL schemes can be used for most grid sizes when surface fluxes are present

- Lowest level should be in the surface layer (0.1h)
 - Important for surface (2m, 10m) diagnostic interpolation
- With ACM2, GFS and MRF PBL schemes, lowest full level should be .99 or .995 not too close to 1
- TKE schemes can use thinner surface layers
- Assumes that PBL eddies are not resolved
- At grid size $dx \ll 1$ km, this assumption breaks down
 - Can use 3d diffusion instead of a PBL scheme in Version 3 (coupled to surface physics)
 - Works best when dx and dz are comparable

Large-Eddy Simulation

- For grid sizes of up to about 100 m, LES is preferable
- LES treats turbulence three-dimensionally instead of separate vertical (PBL) and horizontal diffusion schemes
- TKE and 3d Smagorinsky options exist for the sub-grid turbulence

Large-Eddy Simulation

- To run LES mode
 - Use `bl_pbl_physics=0` and `diff_opt=2` with `km_opt=2` or `3`
 - This scheme can also use real surface fluxes from the surface physics (heat, moisture, momentum stress) or idealized constant values

LES schemes

Unified horizontal and vertical mixing (for $dx \sim dz$).

Typically needed for $dx < \sim 200$ m. Also use `mix_isotropic=1`.

bl_pbl_physics	diff_opt	km_opt	Scheme	Cores	sf_sfclay_physics	isfflx	Prognostic variables
0	2	2	tke	ARW	0,1,2	0,1,2	tke
0	2	3	3d Smagorinsky	ARW	0,1,2	0,1,2	

Namelist isfflx controls surface flux methods

isfflx	sf_sfclay_physics	Heat flux	Drag	Real/Ideal
0	0	From namelist tke_heat_flux	From namelist tke_drag_coefficient	Ideal
1	1,2	From LSM/sfclay physics (HFX, QFX)	From sfclay physics (UST)	Real
2	1,2	From namelist tke_heat_flux	From sfclay physics (UST)	Ideal

Other Options

- Gravity-wave drag can be added for low resolution (> 10 km) runs to represent sub-grid orographic gravity-wave vertical momentum transport (gwd_opt=1)
- Wind-farm model has been added to investigate wind-farm effects on the environment (extra stress and turbulence generation)
- topo_wind=1,2: wind-bias correction methods for terrain effects
- Fog: grav_settling=2 (Katata)

ARW only

bldt

- Minutes between boundary layer/LSM calls
- Typical value is 0 (every step)

Turbulence/Diffusion

Sub-grid eddy mixing effects on all
fields, e.g.

$$\frac{\partial}{\partial x} K_h \frac{\partial}{\partial x} \theta + \frac{\partial}{\partial y} K_h \frac{\partial}{\partial y} \theta + \frac{\partial}{\partial z} K_v \frac{\partial}{\partial z} \theta$$

Difference between diff_opt 1 and 2

diff_opt=1

Horizontal diffusion acts along model levels

Simpler numerical method with only neighboring points on the same model level

Difference between diff_opt 1 and 2

diff_opt=2

Horizontal diffusion acts on horizontal gradients

Numerical method includes vertical correction term
using more grid points

ARW only

km_opt

- km_opt selects method for computing K coefficient
 - km_opt=1: constant (use khdif and kvdif to specify – idealized)
 - km_opt=2: 3d tke prediction used to compute K (requires diff_opt=2)
 - km_opt=3: 3d Smagorinsky diagnostic K (requires diff_opt=2)
 - km_opt=4: 2d Smagorinsky for horizontal K (to be used with PBL or kvdif for vertical K)

ARW only

sfs_opt

- Sub-filter-scale stress model for LES applications impacting momentum mixing (Kosovic, Mirocha)
 - sfs_opt=0 (default) off
 - sfs_opt=1 Nonlinear Backscatter and Anisotropy (NBA) option 1: using diagnostic stress terms (km_opt=2,3)
 - sfs_opt=2 NBA option 2: using tke-based stress terms (km_opt=2 only)
 - Also m_opt=1 for added outputs of SGS stresses

Diffusion Option Choice

- Real-data case with PBL physics on
 - Best is `diff_opt=1`, `km_opt=4`
 - From V3.6 `diff_opt=2` can be used with `km_opt=4` (was unstable with complex terrain before so not recommended)
 - This complements vertical diffusion done by PBL scheme
- High-resolution real-data cases (~100 m grid)
 - No PBL
 - `diff_opt=2`; `km_opt=2,3` (tke or Smagorinsky scheme)
- Idealized cloud-resolving (`dx = 1-3 km`) modeling (smooth or no topography, no surface heat fluxes)
 - `diff_opt=2`; `km_opt=2,3`
- Complex topography with no PBL scheme
 - `diff_opt=2` is more accurate for sloped coordinate surfaces, and prevents diffusion up/down valley sides but sometimes unstable with complex terrain
- Note: WRF can run with no diffusion (`diff_opt=0`)

ARW only

diff_6th_opt

- 6th order optional added horizontal diffusion on model levels
 - Used as a numerical filter for $2 \cdot dx$ noise
 - Suitable for idealized and real-data cases
 - Affects all advected variables including scalars
- diff_6th_opt
 - 0: none (default)
 - 1: on (can produce negative water)
 - 2: on and prohibit up-gradient diffusion (better for water conservation)
- diff_6th_factor
 - Non-dimensional strength (typical value 0.12, 1.0 corresponds to complete removal of $2 \cdot dx$ wave in a time-step)

Upper damping (damp_opt)^{ARW only}

Purpose is to prevent unrealistic reflections of waves from model top. Can be important over high topography.

Options

- 1: Upper level diffusive layer
- 2: Rayleigh damping (idealized only – needs input sounding)
- 3: w-Rayleigh damping (damps w only)

All options use

- Cosine function of height
- Additional parameters
 - zdamp: depth of damping layer
 - dampcoef: nondimensional maximum magnitude of damping

Cumulus Parameterization

Provides

Atmospheric heat and moisture/cloud
tendency profiles

Surface sub-grid-scale (convective) rainfall

Illustration of Cumulus Processes

Cumulus Schemes

- Use for grid columns that completely contain convective clouds
- Re-distribute air in column to account for vertical convective fluxes
 - Updrafts take boundary layer air upwards
 - Downdrafts take mid-level air downwards
- Schemes have to determine
 - When to trigger a convective column
 - How fast to make the convection act

Deep Convection

- Schemes work in individual columns that are considered convectively unstable
- Mass-flux schemes transport surface air to top of cloud and include subsidence
- Subsidence around cloud warms and dries troposphere removing instability over time
- Additionally downdrafts may cool PBL

Parameterizations of cumulus convection

WRF Cumulus Parameterization Options

- Cumulus schemes fall into two main classes
 - Adjustment type (Betts-Miller-Janjic)
 - Relaxes towards a post-convective (mixed) sounding
 - Mass-flux type (all others in WRF)
 - Determines updraft (and often downdraft) mass flux and other fluxes (sometimes including momentum transport)

Cumulus schemes in V3.7

Triggers

- Clouds only activate in columns that meet certain criteria
 - Presence of some convective available potential energy (CAPE) in sounding
 - Not too much convective inhibition (CIN) in sounding (cap strength)
 - Minimum cloud depth from parcel ascent

Closures

- Closure determine cloud strength (mass-flux) based on various methods
 - Clouds remove CAPE over time
 - Specified CAPE-removal time scale (KF, Tiedtke, ZM, BMJ)
 - Quasi-equilibrium (Arakawa-Schubert) with large-scale destabilization $d(\text{CAPE})/dt$ (SAS, NSAS)
 - Column moisture convergence
 - Low-level large-scale ascent (mass convergence)

Ensemble methods

- GF, G3 and GD use ensemble of triggers and closures possibly with with varying parameters (up to 144 members)
- Take mean of ensemble to feed back to model
- In principle, can be tuned to emphasize various members under different conditions

Shallow Convection

- Non-precipitating shallow mixing dries PBL, moistens and cools above
- This can be done by an enhanced mixing approach (SAS, GRIMS) or mass-flux approach (KF, NSAS, Tiedtke, G3, GF)
- May be useful at grid sizes that do not resolve shallow cumulus clouds (> 1 km)

Shallow Convection

- Cumulus schemes may include shallow convection (KF, SAS schemes, G3, GF, BMJ, Tiedtke)
- Standalone shallow schemes
 - UW Park-Bretherton (shcu_physics=2)
 - GRIMS shallow scheme (shcu_physics=3)
- Part of PBL schemes with mass-flux method
 - TEMF PBL option (bl_bl_physics=10)
 - GBM PBL option (bl_bl_physics=12)
 - QNSE-EDMF PBL (bl_bl_physics=4)

Momentum Transport

- Some cumulus parameterizations also have momentum transport (SAS, NSAS, Tiedtke, ZM)
- Most schemes transport momentum as a passive scalar but ZM and NSAS include a convective pressure gradient term

Cloud Detrainment

- Most schemes detrain cloud and ice at cloud top (except BMJ)
- KF schemes also detrain snow and rain
- These are then used by the microphysics

ARW only

cudt

- Time between cumulus scheme calls
- Typical value is 5 minutes
 - Note: for KF scheme this is also used for averaging time for vertical velocity trigger
 - Not used by G3 or GD schemes

Cumulus schemes in V3.7

cu_physics	Scheme	Cores	Moisture Tendencies	Momentum Tendencies	Shallow Convection

93	Grell-Devenyi	ARW	Qc Qi	no	no
99	Old Kain-Fritsch	ARW	Qc Qr Qi Qs	no	no

Cumulus scheme

Recommendations about use

- For $dx \geq 10$ km: probably need cumulus scheme
- For $dx \leq 3$ km: probably do not need scheme
 - However, there are cases where the earlier triggering of convection by cumulus schemes help
- For $dx=3-10$ km, scale separation is a question
 - Few schemes are specifically designed with this range of scales in mind
 - G3 has an option to spread subsidence in neighboring columns
 - GF phases out deep convection at fine grid size
- Issues with 2-way nesting when physics differs across nest boundaries (seen in precip field on parent domain)
 - best to use same physics in both domains or 1-way nesting or make nested domain large enough to keep parent effects away from interior

Microphysics

Provides

Atmospheric heat and moisture tendencies

Microphysical rates

Surface resolved-scale rainfall

Resolved clouds

- Formed by radiative, dynamical or convective processes
- Model only considers grid-scale average so will not resolve fine-scale structures

Microphysics Parameterization

Illustration of Microphysics Processes

WRF Microphysics Options (mp_physics)

- Range of levels of sophistication
 - Warm rain (i.e. no ice) – Kessler (idealized)
 - Simple ice (3 arrays) – WSM3
 - Mesoscale (5 arrays, no graupel) – WSM5
 - Cloud-scale single-moment (6 arrays, graupel) – WSM6, Lin, Goddard, SBU, Eta-Ferrier
 - Double-moment (8-13 arrays) – Thompson, Morrison, Milbrandt-Yau, WDM5, WDM6
 - Spectral Bin (120-240 arrays)

Microphysics schemes in V3.7

Microphysics

- Latent heat release from
 - Condensation, evaporation, deposition, sublimation, freezing, melting
- Particle types
 - Cloud water, rain drops, ice crystals, snow, graupel (also hail in some)
 - Total mass contributes to liquid loading in dynamics
- Processes
 - Aggregation, accretion, growth, fall-out

Microphysics: Single and Double Moment Schemes

- Single-moment schemes have one prediction equation for mass (kg/kg) per species (Q_r , Q_s , etc.) with particle size distribution being derived from fixed parameters
- Double-moment (DM) schemes add a prediction equation for number concentration ($\text{\#/kg}$) per DM species (N_r , N_s , etc.)
 - DM schemes may only be double-moment for a few species
 - DM schemes allow for additional processes such as size-sorting during fall-out and sometimes aerosol (CCN) effects

Spectral Bin Schemes

- New in V3.6 (Hebrew University of Jerusalem, Khain and Lynn scheme)
- Size distribution resolved by doubling mass bins (typically 32 for each particle type)
- Many added advected arrays (expensive)
 - Options have 4x32 or 8x32 arrays

Microphysics: Fall terms

- Microphysics schemes handle fall terms for particles (usually everything except cloud water has a fall term)
- For long time-steps (such as mesoscale applications $\Delta t \sim 60$ s, $V_t = 5$ m/s), drops may fall more than a grid level in a time-step
- This requires splitting the time-step (most schemes) or lagrangian numerical methods (WSM and WDM schemes) to keep the scheme numerically stable

Interaction with Aerosols

- WRF-Chem can provide aerosols to some options (Lin, Morrison, CESM)
- WDM, an NSSL option, and spectral bin schemes can advect idealized CCNs which affect cloud droplet number
- Thompson “aerosol-aware” scheme (new in V3.6) can use its own aerosol climatology

Interaction with Radiation

- Several schemes now pass their own ice, snow, cloud-water particle sizes to RRTMG radiation
 - Thompson, WSM, WDM, NSSL 2-mom schemes
 - Other schemes do not and radiation uses internal assumptions about particle sizes

Microphysics schemes in V3.7

* Advects only total condensate Nn= CCN number

Microphysics Options

Recommendations about choice

- Probably not necessary to use a graupel scheme for $dx > 10$ km
 - Updrafts producing graupel not resolved
 - Cheaper scheme may give similar results
- When resolving individual updrafts, graupel scheme should be used
- All domains use same option

Rainfall Output

- Cumulus and microphysics can be run at the same time
- ARW outputs rainfall accumulations since simulation start time (0 hr) in mm
- RAINC comes from cumulus scheme
- RAINNC comes from microphysics scheme
- Total is RAINC+RAINNC
 - RAINNCV is time-step value
 - SNOWNC/SNOWNCV are snow sub-set of RAINC/RAINNCV (also GRAUPELNC, etc.)

Physics Interactions

Direct Interactions of Parameterizations

Physics in Multiscale NWP Model

Solver Calling Sequence (ARW example)

Call to solver advances one domain by one model time-step

- Physics tendencies
 - Radiation, surface, land-state update, PBL, cumulus, grid-fdda, obs-fdda
- Dynamics tendencies
 - Diffusion, advection, dynamics terms (for 3d momentum, theta, geopotential, surface pressure)
- Acoustic steps
 - Update 3d momentum, theta, surface pressure, height
- Scalar dynamics tendencies and update
 - Advection, diffusion of moist (q_v, q_c , etc.), scalar, tracer, tke, (and chemistry) variables
- Microphysics update
