

## Dynamics: Introduction

# The Advanced Research WRF (ARW) Dynamics Solver

1. What is a dynamics solver?
2. Variables and coordinates
3. Equations
4. Time integration scheme
5. Grid staggering
6. Advection (transport) and conservation
7. Time step parameters
8. Filters
9. Map projections and global configuration
10. Boundary condition options

### WRF ARW Tech Note

A Description of the Advanced Research WRF Version 4 (March 2019)  
<http://www2.mmm.ucar.edu/wrf/users/docs/technote/contents.html>

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 2. Variables and coordinates

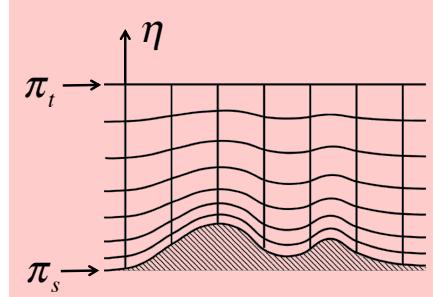

### Vertical coordinates: (1) Traditional terrain-following mass coordinate

$$\text{Dry hydrostatic pressure } \pi_d$$

$$\text{Column mass (per unit area)} \mu_d = \pi_s - \pi_t$$

$$\text{Vertical coordinate } \eta = \frac{(\pi_d - \pi_t)}{\mu_d}$$

$$\text{Layer mass (per unit area)} \mu_d \Delta \eta = \Delta \pi_d = -g \rho_d \Delta z, \quad \text{Pressure } \pi_d(\eta) = \eta \mu_d + \pi_t$$

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

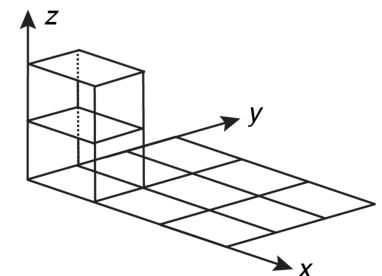

## Dynamics: 1. What is a *dynamics solver*?

A *dynamical solver* (or a *dynamical core*, or *dycore*) performs a time ( $t$ ) and space ( $x,y,z$ ) integration of the equations of motion.

Given the 3D atmospheric state at time  $t$ ,  $S(x,y,z,t)$ , we integrate the equations forward in time from  $t \rightarrow T$ , i.e. we run the model and produce a forecast.

The equations cannot be solved analytically, so we *discretize* the equations on a *grid* and compute *approximate* solutions.

The accuracy of the solutions depend on the numerical method and the mesh spacing (grid).

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 2. Variables and coordinates

### Vertical coordinates: (2) Hybrid terrain-following mass coordinate

Isobaric coordinate (constant pressure):

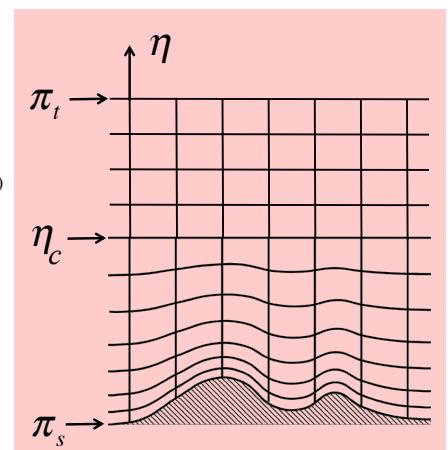

$$\eta = \frac{\pi_d}{\pi_0 - \pi_t}$$

Hybrid terrain-following coordinate:

$$\pi_d(\eta) = B(\eta) \mu_d + \pi_t \quad (\text{Terrain-following}) \\ + [\eta - B(\eta)] (\pi_0 - \pi_t) \quad (\text{Isobaric})$$

level at which  $B \rightarrow 0$ ,  
i.e. transition between  
isobaric and  
terrain-following coordinate.

Default WRFV4 configuration:  
Hybrid coordinate is enabled,  $\eta_c = 0.2$

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 2. Variables and coordinates

Variables:

Grid volume mass (per unit area):

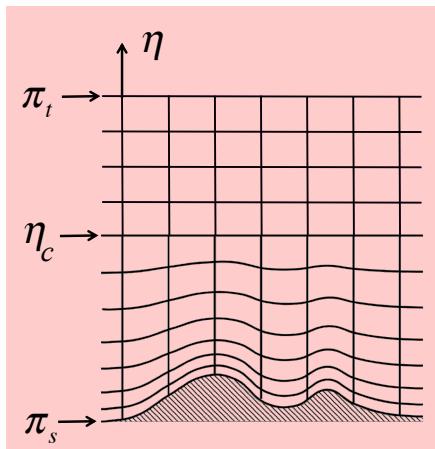

$$\mu_d = \frac{\partial \pi_d}{\partial \eta} = B_\eta (\pi_s - \pi_t) + (1 - B_\eta)(\pi_0 - \pi_t)$$

Conserved state (prognostic) variables:

$$\begin{aligned} \mu_d, \quad U &= \mu_d u, \quad V = \mu_d v, \\ W &= \mu_d w, \quad \Theta = \mu_d \theta \end{aligned}$$

Non-conserved state variable:

$$\phi = gz$$

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 3. Equations

$$\begin{aligned} \frac{\partial U}{\partial t} &= \\ \frac{\partial V}{\partial t} &= \\ \frac{\partial W}{\partial t} &= \\ \frac{\partial \mu_d}{\partial t} &= \\ \frac{\partial \Theta}{\partial t} &= \\ \frac{\partial \mu_d q_j}{\partial t} &= \\ \frac{\partial \phi}{\partial t} &= \end{aligned}$$

## Dynamics: 2. Variables and coordinates

Subscript  $d$  denotes dry, and

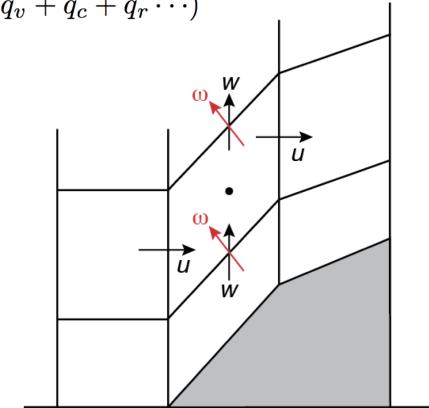

$$\alpha_d = \frac{1}{\rho_d} \quad \alpha = \alpha_d (1 + q_v + q_c + q_r \dots)^{-1}$$

$$\rho = \rho_d (1 + q_v + q_c + q_r \dots)$$

covariant ( $u, \omega$ ) and  
contravariant  $w$  velocities

$$u = \frac{dx}{dt}, \quad w = \frac{dz}{dt}, \quad \omega = \frac{d\eta}{dt}$$

$$U = \mu u, \quad W \mu w, \quad \Omega = \mu \omega$$

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 3. Equations

transport

$$\begin{aligned} \frac{\partial U}{\partial t} &= -\frac{\partial U u}{\partial x} - \frac{\partial V u}{\partial y} - \frac{\partial \Omega u}{\partial \eta} \\ \frac{\partial V}{\partial t} &= -\frac{\partial U v}{\partial x} - \frac{\partial V v}{\partial y} - \frac{\partial \Omega v}{\partial \eta} \\ \frac{\partial W}{\partial t} &= -\frac{\partial U w}{\partial x} - \frac{\partial V w}{\partial y} - \frac{\partial \Omega w}{\partial \eta} \\ \frac{\partial \mu_d}{\partial t} &= -\frac{\partial U}{\partial x} - \frac{\partial V}{\partial y} - \frac{\partial \Omega}{\partial \eta} \\ \frac{\partial \Theta}{\partial t} &= -\frac{\partial U \theta}{\partial x} - \frac{\partial V \theta}{\partial y} - \frac{\partial \Omega \theta}{\partial \eta} \\ \frac{\partial \mu_d q_j}{\partial t} &= -\frac{\partial U q_j}{\partial x} - \frac{\partial V q_j}{\partial y} - \frac{\partial \Omega q_j}{\partial \eta} \\ \frac{\partial \phi}{\partial t} &= -u \frac{\partial \phi}{\partial x} - v \frac{\partial \phi}{\partial y} - \omega \frac{\partial \phi}{\partial \eta} \end{aligned}$$

Diagnostic relations:  $\frac{\partial \phi}{\partial \eta} = -\alpha_d \mu_d, p = \left( \frac{R_d \Theta_m}{p_o \mu_d \alpha_d} \right)^{\gamma}, \Theta_m = \Theta \left( 1 + \frac{R_v}{R_d} q_v \right)$

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 4. Time integration scheme

### 3<sup>rd</sup> Order Runge-Kutta time integration

$\frac{\partial U}{\partial t} = RHS_u$	advance $\phi^t \rightarrow \phi^{t+\Delta t}$
$\frac{\partial V}{\partial t} = RHS_v$	$\phi^* = \phi^t + \frac{\Delta t}{3} RHS(\phi^t)$
$\frac{\partial W}{\partial t} = RHS_w$	$\phi^{**} = \phi^t + \frac{\Delta t}{2} RHS(\phi^*)$
•	•
•	$\phi^{t+\Delta t} = \phi^t + \Delta t RHS(\phi^{**})$

Amplification factor  $\phi_t = ik\phi; \phi^{n+1} = A\phi^n; |A| = 1 - \frac{(k\Delta t)^4}{24}$

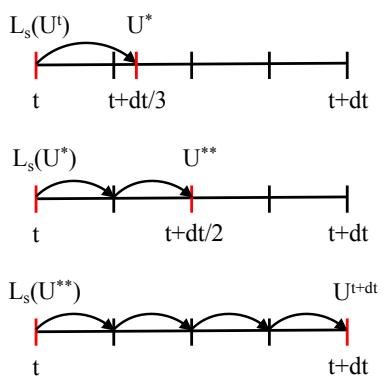

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 4. Time integration scheme – time splitting

$$U_t = L_{\text{fast}}(U) + L_{\text{slow}}(U)$$

3rd order Runge-Kutta, 3 steps

*fast*: acoustic and gravity wave terms.

*slow*: everything else.

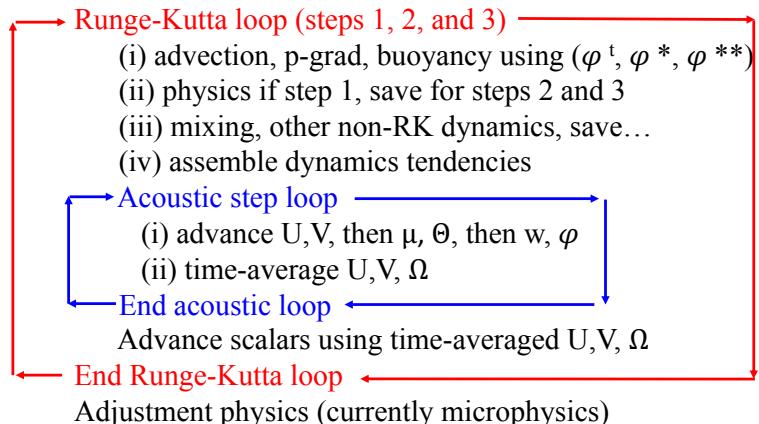

- RK3 is 3rd order accurate for linear eqns, 2nd order accurate for nonlinear eqns.
- Stable for centered and upwind advection schemes.
- Stable for Courant number  $Udt/dx < 1.73$
- Three  $L_{\text{slow}}(U)$  evaluations per timestep.

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 4. Time integration scheme - implementation

Begin time step

End time step

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 4. Time integration scheme – acoustic step

$$U^{t+\Delta t}, \quad V^{t+\Delta t}$$

$$\mu_d^{\tau+\Delta\tau} \quad \Omega^{\tau+\Delta\tau}$$

$$\Theta^{\tau+\Delta\tau}$$

$$W^{\tau+\Delta\tau}$$

$$\phi^{\tau+\Delta\tau}$$

$$\frac{\partial U}{\partial t} + \left( \mu_d \alpha \frac{\partial p}{\partial x} + \frac{\alpha}{\alpha_d} \frac{\partial p}{\partial \eta} \frac{\partial \phi}{\partial x} \right)^{\tau} = R_U^t$$

$$\frac{\partial \mu_d}{\partial t} + \frac{\partial U^{\tau+\Delta\tau}}{\partial x} + \frac{\partial \Omega^{\tau+\Delta\tau}}{\partial \eta} = 0$$

$$\frac{\partial \Theta}{\partial t} + \left( \frac{\partial U \theta^t}{\partial x} + \frac{\partial \Omega \theta^t}{\partial \eta} \right)^{\tau+\Delta\tau} = R_\Theta^t$$

$$\frac{\partial W}{\partial t} + g \left( \mu_d - \frac{\alpha}{\alpha_d} \frac{\partial p}{\partial \eta} \right)^{\tau} = R_W^t$$

$$\mu_d^t \frac{\partial \phi}{\partial t} + U^{\tau+\Delta\tau} \frac{\partial \phi^t}{\partial x} + \Omega^{\tau+\Delta\tau} \frac{\partial \phi^t}{\partial \eta} - g \bar{W}^\tau = R_\phi^t$$

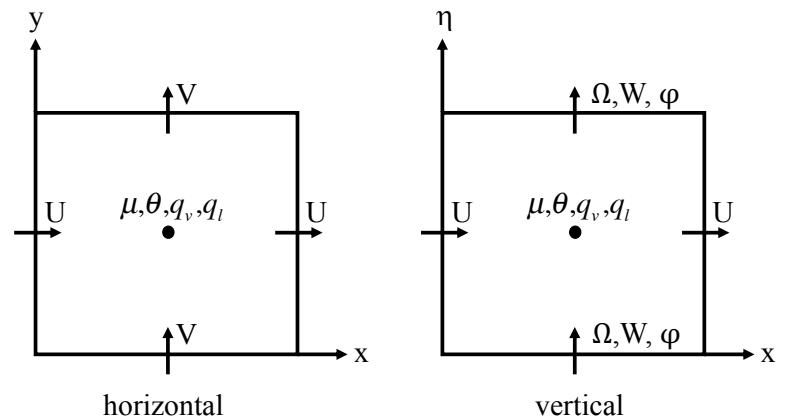

- Forward-backward differencing on  $U$ ,  $\Theta$ , and  $\mu$  equations
- Vertically implicit differencing on  $W$  and  $\phi$  equations

WRF Tutorial July 2019

## Dynamics: 5. Grid staggering – horizontal and vertical

C-grid staggering

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 6. Advection (transport) and conservation – dry-air mass

transport      pressure gradient

$$\begin{aligned}
 \frac{\partial U}{\partial t} &= -\frac{\partial U u}{\partial x} - \frac{\partial V u}{\partial y} - \frac{\partial \Omega u}{\partial \eta} - \alpha \mu_d \frac{\partial p}{\partial x} - \frac{\alpha}{\alpha_d} \frac{\partial p}{\partial \eta} \frac{\partial \phi}{\partial x} + R_u + Q_u \\
 \frac{\partial V}{\partial t} &= -\frac{\partial U v}{\partial x} - \frac{\partial V v}{\partial y} - \frac{\partial \Omega v}{\partial \eta} - \alpha \mu_d \frac{\partial p}{\partial y} - \frac{\alpha}{\alpha_d} \frac{\partial p}{\partial \eta} \frac{\partial \phi}{\partial y} + R_v + Q_v \\
 \frac{\partial W}{\partial t} &= -\frac{\partial U w}{\partial x} - \frac{\partial V w}{\partial y} - \frac{\partial \Omega w}{\partial \eta} - g \left( \mu_d - \frac{\alpha}{\alpha_d} \frac{\partial p}{\partial \eta} \right) + R_w + Q_w \\
 \frac{\partial \mu_d}{\partial t} &= -\frac{\partial U}{\partial x} - \frac{\partial V}{\partial y} - \frac{\partial \Omega}{\partial \eta} \quad \text{Next:} \\
 \frac{\partial \Theta}{\partial t} &= -\frac{\partial U \theta}{\partial x} - \frac{\partial V \theta}{\partial y} - \frac{\partial \Omega \theta}{\partial \eta} + R_\theta + Q_\theta \\
 \frac{\partial \mu_d q_j}{\partial t} &= -\frac{\partial U q_j}{\partial x} - \frac{\partial V q_j}{\partial y} - \frac{\partial \Omega q_j}{\partial \eta} + R_{q_j} + Q_{q_j} \\
 \frac{\partial \phi}{\partial t} &= -u \frac{\partial \phi}{\partial x} - v \frac{\partial \phi}{\partial y} - \omega \frac{\partial \phi}{\partial \eta} + gw
 \end{aligned}$$

Diagnostic relations:  $\frac{\partial \phi}{\partial \eta} = -\alpha_d \mu_d, p = \left( \frac{R_d \Theta_m}{p_o \mu_d \alpha_d} \right)^r, \Theta_m = \Theta \left( 1 + \frac{R_v}{R_d} q_v \right)$

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 6. Advection (transport) and conservation – dry-air mass

Mass in a control volume  $(\Delta x \Delta \eta)(\mu)^t$   
2D example

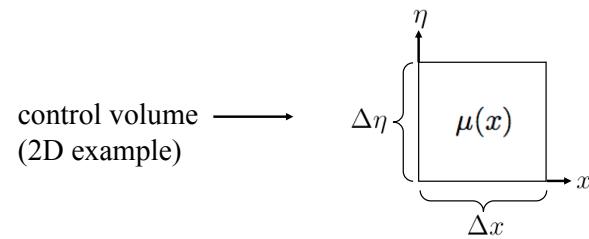

Mass conservation equation

$$\Delta t^{-1}(\Delta x \Delta \eta) \cdot [(\mu)^{t+\Delta t} - (\mu)^t] = [(\mu u \Delta \eta)_{x-\Delta x/2, \eta} - (\mu u \Delta \eta)_{x+\Delta x/2, \eta}] + [(\mu \omega \Delta x)_{x, \eta-\Delta \eta/2} - (\mu \omega \Delta x)_{x, \eta+\Delta \eta/2}]$$

Change in mass over a time step

mass fluxes through  
control volume faces

## Dynamics: 6. Advection (transport) and conservation – dry-air mass

Mass in a control volume is proportional to

$$(\Delta x \Delta \eta)(\mu)^t$$

since  $\mu(x) \Delta \eta = \Delta \pi = -g \rho \Delta z$

WRF Tutorial July 2019

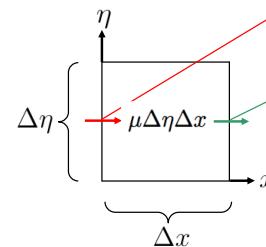

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 6. Advection (transport) and conservation – dry-air mass

Mass in a control volume  $(\Delta x \Delta \eta)(\mu)^t$

Mass conservation equation

$$\Delta t^{-1}(\Delta x \Delta \eta) \cdot [(\mu)^{t+\Delta t} - (\mu)^t] = [(\mu u \Delta \eta)_{x-\Delta x/2, \eta} - (\mu u \Delta \eta)_{x+\Delta x/2, \eta}] + [(\mu \omega \Delta x)_{x, \eta-\Delta \eta/2} - (\mu \omega \Delta x)_{x, \eta+\Delta \eta/2}]$$

Horizontal fluxes through the  
vertical control-volume faces

Transport  
schemes: flux  
divergence  
(transport) options  
in WRF

## Dynamics: 6. Advection (transport) and conservation

2<sup>nd</sup>, 3<sup>rd</sup>, 4<sup>th</sup>, 5<sup>th</sup> and 6<sup>th</sup> order centered and upwind-biased schemes are available in the ARW model.

Example: 5<sup>th</sup> order scheme

$$\frac{\partial(U\psi)}{\partial x} = \frac{1}{\Delta x} \left( F_{i+\frac{1}{2}}(U\psi) - F_{i-\frac{1}{2}}(U\psi) \right)$$

where

$$F_{i-\frac{1}{2}}(U\psi) = U_{i-\frac{1}{2}} \left\{ \frac{37}{60}(\psi_i + \psi_{i-1}) - \frac{2}{15}(\psi_{i+1} + \psi_{i-2}) + \frac{1}{60}(\psi_{i+2} + \psi_{i-3}) \right\} \\ - sign(1,U) \frac{1}{60} \left\{ (\psi_{i+2} - \psi_{i-3}) - 5(\psi_{i+1} - \psi_{i-2}) + 10(\psi_i - \psi_{i-1}) \right\}$$

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 6. Advection (transport) and conservation

For constant U, the 5<sup>th</sup> order flux divergence tendency becomes

$$\Delta t \frac{\delta(U\psi)}{\Delta x} \Big|_{5th} = \Delta t \frac{\delta(U\psi)}{\Delta x} \Big|_{6th} \\ - \underbrace{\left[ \frac{U \Delta t}{\Delta x} \right] \frac{1}{60} (-\psi_{i-3} + 6\psi_{i-2} - 15\psi_{i-1} + 20\psi_i - 15\psi_{i+1} + 6\psi_{i+2} - \psi_{i+3})}_{Cr \frac{\partial^6 \psi}{\partial x^6} + H.O.T}$$

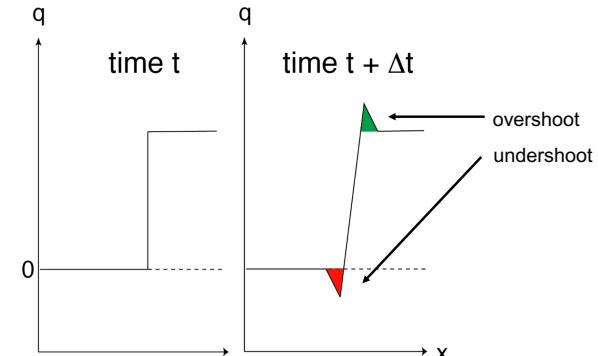

The odd-ordered flux divergence schemes are equivalent to the next higher ordered (even) flux-divergence scheme plus a dissipation term of the higher even order with a coefficient proportional to the Courant number.

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 6. Advection (transport) and conservation – shape preserving

1D advection

ARW transport is conservative,  
but not positive definite nor monotonic.  
Removal of negative q █  
results in spurious source of q █.

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 6. Advection (transport) and conservation – shape preserving

Scalar update, last RK3 step

$$(\mu\phi)^{t+\Delta t} = (\mu\phi)^t - \Delta t \sum_{i=1}^n \delta_{x_i}[f_i] \quad (1)$$

(1) Decompose flux:  $f_i = f_i^{upwind} + f_i^c$

(2) Renormalize high-order correction fluxes  $f_i^c$  such that solution is positive definite or monotonic:  $f_i^c = R(f_i^c)$

(3) Update scalar eqn. (1) using  $f_i = f_i^{upwind} + R(f_i^c)$

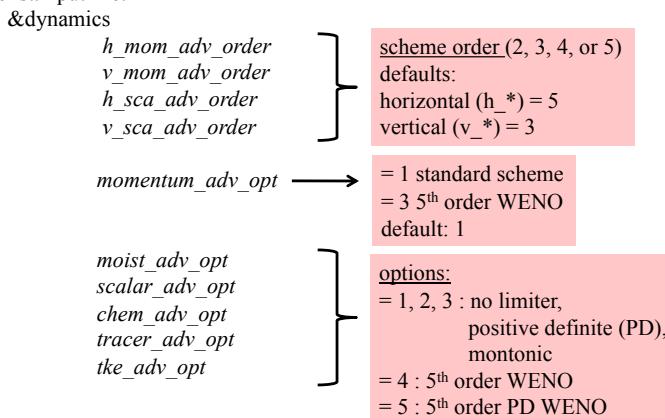

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 6. Advection (transport) and conservation

Where are the transport-scheme parameters?

The namelist.input file:

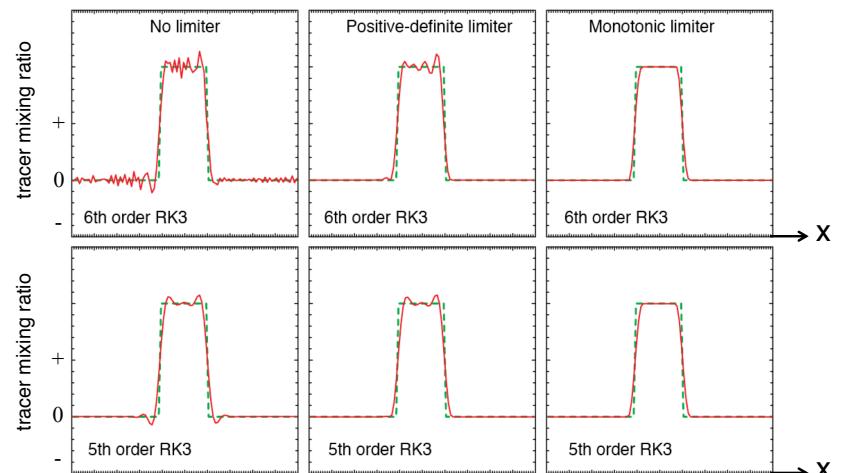

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 6. Advection (transport) and conservation – examples

### 1D Example: Top-Hat Advection

1D Top-hat transport Cr = 0.5, 1 revolution, 200 steps

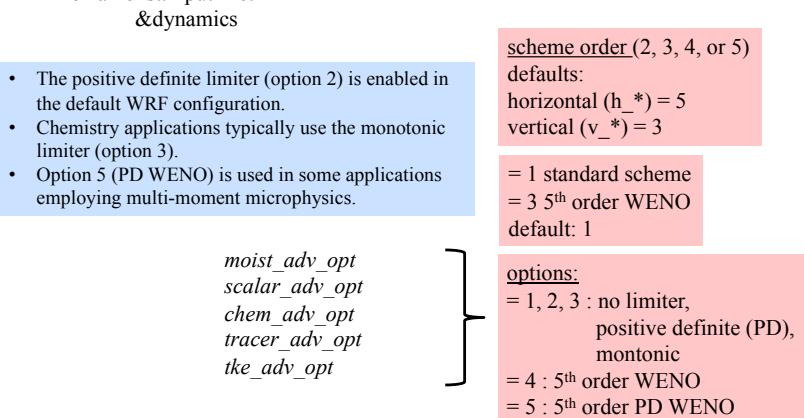

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 6. Advection (transport) and conservation

Where are the transport-scheme parameters?

The namelist.input file:

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 7. Time step parameters

3<sup>rd</sup> order Runge-Kutta time step  
(the main timestep in WRF)  $\Delta t_{RK}$

Where? The namelist.input file:  
&domains

*time\_step (integer seconds)*  
*time\_step\_fract\_num*  
*time\_step\_fract\_den*

### Guidelines for time step selection

$\Delta t_{RK}$  in seconds should be about  $6\Delta x$  (grid size in kilometers).

For example, for  $\Delta x=10\text{ km}$  choose  $\Delta t=60$  seconds.

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 7. Time step parameters

3<sup>rd</sup> order Runge-Kutta time step  $\Delta t_{RK}$  (&domains *time\_step*)

Acoustic time step [&dynamics *time\_step\_sound* (integer)]

Are the RK and/or acoustic timesteps too big?

If ARW blows up (aborts) quickly (possibly and dynamics instability), try:

- (1) Decreasing  $\Delta t_{RK}$  (this also decreases  $\Delta \tau_{acoustic}$ ), or
- (2) increasing the integer *time\_step\_sound*  
(this decreases  $\Delta \tau_{acoustic}$  but does not change  $\Delta t_{RK}$ ).

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 7. Time step parameters

3<sup>rd</sup> order Runge-Kutta time step  $\Delta t_{RK}$  (&domains *time\_step*)  
(the main timestep in WRF)

$\Delta t_{RK}$  in seconds should be about  $6\Delta x$  (grid size in kilometers).

### Acoustic time step

2D horizontal Courant number limited:

$$\Delta \tau_{acoustic} = \Delta t_{RK} / (\text{number of acoustic steps})$$

Where? The namelist.input file:  
&dynamics  
*time\_step\_sound* (an even integer  $\geq 2$ )

The ARW default for *time\_step\_sound* is 4

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 8. Filters – divergence damping

Purpose: filter acoustic modes (3-D divergence,  $D = \nabla \cdot \rho \mathbf{V}$ )

$$\left\{ \frac{\partial \rho \mathbf{V}}{\partial t} + \nabla p + \dots = \gamma'_d \nabla D \right\}$$

$$\nabla \cdot \left\{ \quad \right\} \rightarrow \frac{\partial D}{\partial t} + \nabla^2 p + \dots = \gamma'_d \nabla^2 D$$

From the pressure equation:  $p_t \simeq c^2 D$

$$\frac{\partial \rho \mathbf{V}}{\partial t} + \nabla [p_\tau + \gamma_d (p^\tau - p^{\tau-\Delta\tau})] + \dots = 0$$

$\gamma_d = 0.1$  recommended (default) (&dynamics *smdiv*)

(Illustrated in height coordinates for simplicity)

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 8. Filters – time off-centering the vertical acoustic modes

Purpose: damp vertically-propagating acoustic modes

$$\frac{\partial W}{\partial t} + g \left( \mu_d - \frac{\alpha}{\alpha_d} \frac{\partial p}{\partial \eta} \right)^\tau = \dots$$

$$\frac{\partial \phi}{\partial t} - \frac{g}{\mu_d^t} \bar{W}^\tau = \dots$$

$$(\overline{\phantom{x}})^\tau = \frac{1+\beta}{2} (\overline{\phantom{x}})^{\tau+\Delta\tau} + \frac{1-\beta}{2} (\overline{\phantom{x}})^\tau$$

Slightly forward centering the vertical pressure gradient damps 3-D divergence as demonstrated for the divergence damper

$\beta = 0.1$  recommended (default) [&dynamics *epssm*]

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 8. Filters – vertical velocity damping

Purpose: damp anomalously-large vertical velocities  
(usually associated with anomalous physics tendencies)

Additional term:

$$\partial_t W = \dots - \mu_d \text{ sign}(W) \gamma_w (Cr - Cr_\beta)$$

$$Cr = \left| \frac{\Omega dt}{\mu d\eta} \right|$$

$Cr_\beta = 1.0$  typical value (default)  
[share/module\_model\_constants.F *w\_beta*]  
 $\gamma_w = 0.3 \text{ m/s}^2$  recommended (default)  
[share/module\_model\_constants.F *w\_alpha*]  
[&dynamics *w\_damping* 0 (off; default) 1 (on)]

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 8. Filters – external mode filter

Purpose: filter the external mode

$$\text{Vertically integrated horizontal divergence, } D_h = \int_1^0 (\nabla_\eta \cdot \mu \mathbf{V}_h) d\eta$$

$$\left\{ \frac{\partial \mu \mathbf{V}_h}{\partial t} + \dots = -\gamma_e \nabla_\eta D_h \right\}$$

$$\int_1^0 \nabla_\eta \cdot \left\{ \dots \right\} d\eta \rightarrow \frac{\partial D_h}{\partial t} + \dots = \gamma_e \nabla^2 D_h$$

$$\text{Continuity equation: } \frac{\partial \mu}{\partial t} = -\nabla_\eta \cdot \mu \mathbf{V}_h - \frac{\partial \mu \dot{\eta}}{\partial \eta} = D_h$$

$$\frac{\partial \mu \mathbf{V}_h}{\partial \tau} + \dots = -\gamma_e \frac{\Delta x^2}{\Delta \tau} \nabla_\eta (\mu^\tau - \mu^{\tau-\Delta\tau})$$

$\gamma_e = 0.01$  recommended (default) [&dynamics *emdiv*]

(Primarily for real-data applications)

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 8. Filters – 2D Smagorinsky

2nd-Order Horizontal Mixing,  
Horizontal-Deformation-Based  $K_h$

Purpose: mixing on horizontal coordinate surfaces  
(real-data applications) [&dynamics *diff\_opt=1, km\_opt=4*]

$$K_h = C_s^2 l^2 \left[ 0.25(D_{11} - D_{22})^2 + \overline{D_{12}^{xy}} \right]^{\frac{1}{2}}$$

$$\text{where } l = (\Delta x \Delta y)^{1/2}$$

$$D_{11} = 2m^2 [\partial_x(m^{-1}u) - z_x \partial_z(m^{-1}u)]$$

$$D_{22} = 2m^2 [\partial_y(m^{-1}v) - z_y \partial_z(m^{-1}v)]$$

$$D_{12} = m^2 [\partial_y(m^{-1}u) - z_y \partial_z(m^{-1}u) + \partial_x(m^{-1}v) - z_x \partial_z(m^{-1}v)]$$

$C_s = 0.25$  (Smagorinsky coefficient, default value)  
[&dynamics *c\_s*]

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 8. Filters – gravity-wave absorbing layer

Implicit Rayleigh w Damping Layer for Split-Explicit Nonhydrostatic NWP Models (gravity-wave absorbing layer)

$$W^{\tau+\Delta\tau} = W^{*\tau+\Delta\tau} - \Delta\tau R_w(\eta) W^{\tau+\Delta\tau}$$

$$R_w(\eta) = \begin{cases} \gamma_r \sin^2 \left[ \frac{\pi}{2} \left( 1 - \frac{z_{top}-z}{z_d} \right) \right] & \text{for } z \geq (z_{top} - z_d); \\ 0 & \text{otherwise,} \end{cases} \quad \begin{array}{l} R_w(\eta) - \text{damping rate (t}^{-1}) \\ z_d - \text{depth of the damping layer} \\ \gamma_r - \text{damping coefficient} \end{array}$$

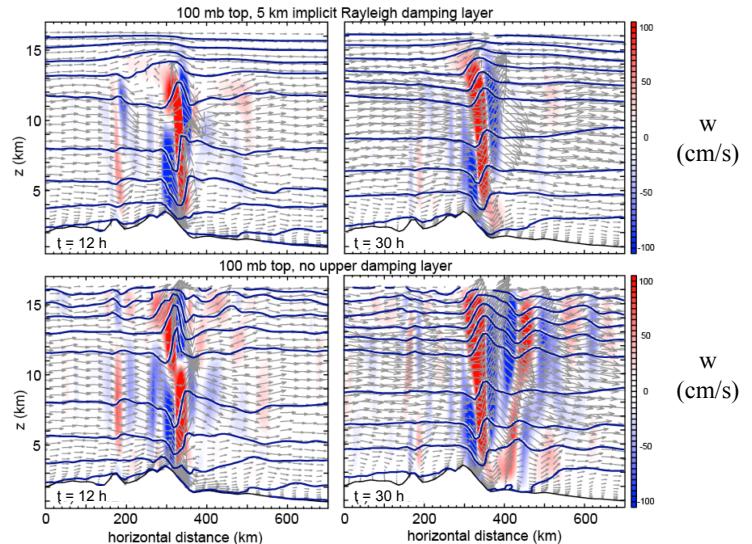

[&dynamics *damp\_opt* = 3 (default = 0)]  
 [&dynamics *damp\_coef* = 0.2 (recommended, = 0. default)]  
 [&dynamics *zdampl* = 5000. (*z\_d* (meters); default); height below model top where damping begins]

## Dynamics: 9. Map projections and global configuration

### ARW Model: projection options

1. Cartesian geometry:  
idealized cases
2. Lambert Conformal:  
mid-latitude applications
3. Polar Stereographic:  
high-latitude applications
4. Mercator:  
low-latitude applications
5. Latitude-Longitude global, regional

Projections 1-4 are isotropic ( $m_x = m_y$ )

Latitude-longitude projection is anisotropic ( $m_x \neq m_y$ )

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

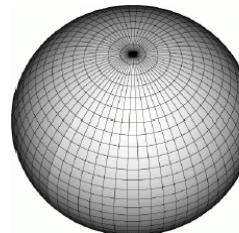

## Dynamics: 9. Map projections and global configuration

### Global ARW – Polar filters

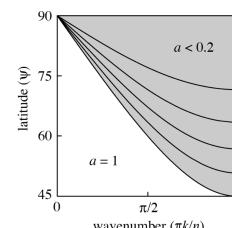

Converging gridlines severely limit timestep.  
The polar filter removes this limitation.

Filter procedure - Along a grid latitude circle:

1. Fourier transform variable.
2. Filter Fourier coefficients.
3. Transform back to physical space.

Filter Coefficient  $a(k), \psi_o = 45^\circ$

$$\hat{\phi}(k)_{filtered} = a(k) \hat{\phi}(k), \quad \text{for all } k$$

$$a(k) = \min \left[ 1., \max \left( 0., \left( \frac{\cos \psi}{\cos \psi_o} \right)^2 \frac{1}{\sin^2(\pi k/n)} \right) \right]$$

$k$  = dimensionless wavenumber

$\hat{\phi}(k)$  = Fourier coefficients from forward transform

$a(k)$  = filter coefficients

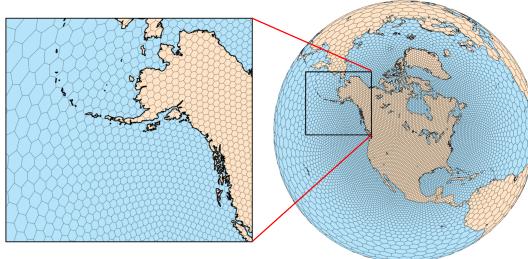

$\psi$  = latitude  $\psi_o$  = polar filter latitude, filter when  $|\psi| > \psi_o$

WRF Tutorial July 2019

Bill Skamarock (skamaroc@ucar.edu)

## Dynamics: 9. Map projections and global configuration

An alternative to  
global ARW...

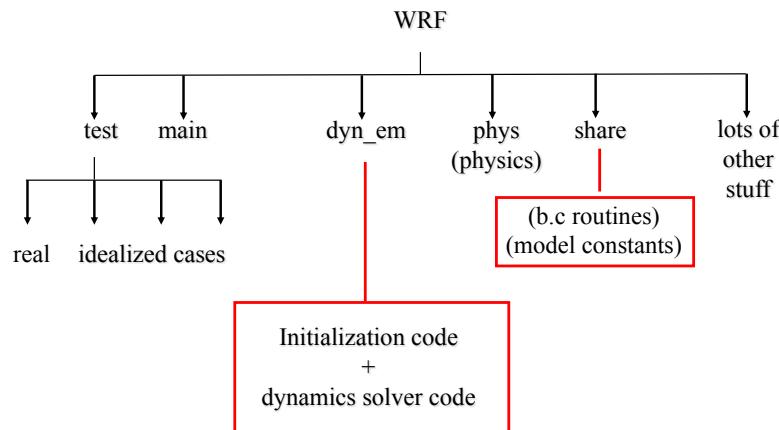

- Global, nonhydrostatic, C-grid Voronoi mesh
- Numerics similar to WRF; WRF-NRCM physics
- No pole problems
- Variable-resolution mesh – no nested BC problems
- Regional capability

## Dynamics: 10. Boundary condition options

ARW Model: Boundary Condition Options

### Lateral boundary conditions

1. Specified (Coarse grid, real-data applications).
2. Open lateral boundaries (gravity-wave radiative).
3. Symmetric lateral boundary condition (free-slip wall).
4. Periodic lateral boundary conditions.
5. Nested boundary conditions (specified).

### Top boundary conditions

1. Constant pressure.

### Bottom boundary conditions

1. Free slip.
2. Various B.L. implementations of surface drag, fluxes.
