

# Recent upgrades and improvements of WRF 4D-Var V3.3

Xin Zhang    Xiang-Yu Huang

NCAR Earth System Laboratory

12th WRF Users' Workshop, Boulder, CO

NCAR is sponsored by the National Science Foundation

## New features

- New WRF tangent linear and adjoint codes (WRFPLUS V3.3) based on the latest WRF repository codes.
- WRFPLUS V3.3 can be used as a standalone tool , such as in application of forecast sensitivity to observation.

## New features

- New WRF tangent linear and adjoint codes (WRFPLUS V3.3) based on the latest WRF repository codes.
- WRFPLUS V3.3 can be used as a standalone tool , such as in application of forecast sensitivity to observation.
- Accurate tangent linear and adjoint check.

## New features

- New WRF tangent linear and adjoint codes (WRFPLUS V3.3) based on the latest WRF repository codes.
- WRFPLUS V3.3 can be used as a standalone tool , such as in application of forecast sensitivity to observation.
- Accurate tangent linear and adjoint check.
- WRF model, WRF tangent linear model and adjoint model are compiled as a library and callable subroutines in WRFDA framework.

## New features

- New WRF tangent linear and adjoint codes (WRFPLUS V3.3) based on the latest WRF repository codes.
- WRFPLUS V3.3 can be used as a standalone tool , such as in application of forecast sensitivity to observation.
- Accurate tangent linear and adjoint check.
- WRF model, WRF tangent linear model and adjoint model are compiled as a library and callable subroutines in WRFDA framework.
- Customized coupler to couple WRFDA, WRF and WRFPLUS as a single executable system.

## New features

- New WRF tangent linear and adjoint codes (WRFPLUS V3.3) based on the latest WRF repository codes.
- WRFPLUS V3.3 can be used as a standalone tool , such as in application of forecast sensitivity to observation.
- Accurate tangent linear and adjoint check.
- WRF model, WRF tangent linear model and adjoint model are compiled as a library and callable subroutines in WRFDA framework.
- Customized coupler to couple WRFDA, WRF and WRFPLUS as a single executable system.
- Robust WRF 4D-Var system across various platforms and compilers ( IBM, Linux, Mac : xlf, pgi, intel, gfortran).

# WRF 4D-Var V3.2: Parallel run using part of processors

4D-Var is a sequential algorithm. However, the old WRF 4D-Var constructed on the Multiple Program Multiple Data mode, which have to split the total processors into 3 subsets for DA, NL and AD/TL. Lots of CPU time are wasted

# WRF 4D-Var V3.3: Parallel run using all processors

Benefit from the single executable framework, every CPU is working at any time. No IDLE any more.

# Performance improvement WRF 4D-Var framework

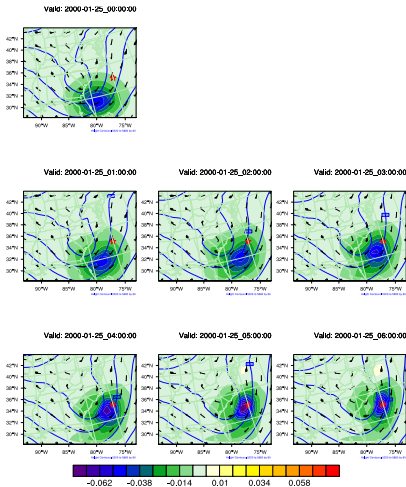

- $270 \times 180 \times 41 @ 20km$ , 6h window, 1h obs\_bin, 10 iterations
- 10 iterations FGAT (identity TL/AD model), NCAR bluefire (IBM P6)

# Single observation experiment I

- Initial time: 2000\_01\_25\_00 : 00 : 00
- Ending time: 2000\_01\_25\_06 : 00 : 00
- Observation: 500 mb temperature at **ending time**  
 $O - B = -1.168K$
- Plotting the difference at **ending time** between the forecast from analysis and from background to investigate the impact of 6h obs. on IC.

## Remarks

Forecasted 500mb T difference  
(DA forecast - reference  
forecast)

- ★ is the location of obs.  
at the ending time (6h).
- Initial perturbation is  
on the upstream of the  
obs.
- Evolved perturbation at  
6h hit the obs. location

## What we learn:

- WRF 4D-Var has the capability to assimilate the observations within a time window.
- WRF 4D-Var produces the flow-dependent analysis increments.

# Consider Lateral boundary condition as control variable

$$J = J_b + J_o + J_c + J_{lbc}$$

$$\begin{aligned} J_{lbc} &= \frac{1}{2}(\mathbf{x}(t_k) - \mathbf{x}_b(t_k))^T \mathbf{B}^{-1}(\mathbf{x}(t_k) - \mathbf{x}_b(t_k)) \\ &= \frac{1}{2} \delta \mathbf{x}(t_k)^T \mathbf{B}^{-1} \delta \mathbf{x}(t_k) \end{aligned}$$

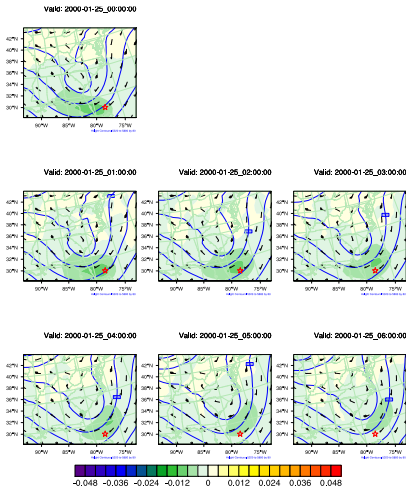

$J_{lbc}$  is the  $J_b$  at the end of the assimilation window and the lateral boundary control is obtained through

$$\frac{\partial \delta \mathbf{x}_{lbc}}{\partial t} = \frac{\delta \mathbf{x}(t_k) - \delta \mathbf{x}(t_0)}{t_k - t_0}$$

## Single observation experiment II

To investigate the impact of lateral boundary control, the 6h observation is placed close to boundary and downstream of the boundary inflow, we expect that the major analysis increments at 0h should be in boundary condition and outside of domain.

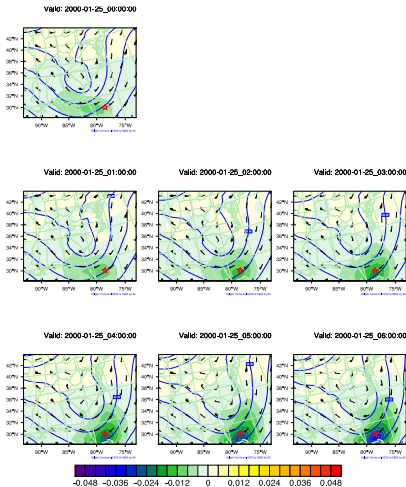

## Remarks

Forecasted 500mb T difference  
(DA forecast - reference  
forecast)

- ★ is the location of obs.  
at the ending time (6h).
- LBC control is **turned  
off**

## Remarks

Forecasted 500mb T difference  
(DA forecast - reference  
forecast)

- ★ is the location of obs.  
at the ending time (6h).
- $O - B = -0.95K$
- LBC control is **turned on**

## What we learn:

- The major increment is in the boundary condition( south boundary, invisible here)
- Increment in initial condition alone is hard to fit the observation.
- For observations close to in-flow boundary, the impact of LBC control is important.

# An OSSE radar data assimilation with WRF 4D-Var

- TRUTH — Initial condition from TRUTH (13-h forecast initialized at 2002061212Z from AWIPS 3-h analysis) run cutted by ndown, boundary condition from NCEP GFS data.
- NODA — Both initial condition and boundary condition from NCEP GFS data.

# An OSSE radar data assimilation with WRF 4D-Var

- TRUTH — Initial condition from TRUTH (13-h forecast initialized at 2002061212Z from AWIPS 3-h analysis) run cutted by ndown, boundary condition from NCEP GFS data.
- NODA — Both initial condition and boundary condition from NCEP GFS data.
- 3DVAR — 3DVAR analysis at 2002061301Z used as the initial condition, and boundary condition from NCEP GFS. Only Radar radial velocity at 2002061301Z assimilated (total data points = 97,033), 3 outer loops.

# An OSSE radar data assimilation with WRF 4D-Var

# OSSE 3rd hour precipitation simulation

## Remarks

- Obviously, 4DVar reproduce the best squall line precipitation band.
- However, the coverage and intensity of the precipitation are more than the observation.

## Remarks

- Obviously, 4DVar reproduce the best squall line precipitation band.
- However, the coverage and intensity of the precipitation are more than the observation.
- Possible improvement: The WRFPLUS V3.3 is a dynamic-only dry model, PBL and microphysics are needed.

## Remarks

- Obviously, 4DVar reproduce the best squall line precipitation band.
- However, the coverage and intensity of the precipitation are more than the observation.
- Possible improvement: The WRFPLUS V3.3 is a dynamic-only dry model, PBL and microphysics are needed.

# Experiment configuration

- Grids: 105x72x28L
- Resolution: 60km
- Period: 2010091100-2010092600 @0Z,6Z,12Z,18Z
- First guess is the 12h forecast from NCEP FNL
- 48h forecasts from FG (control), 3DVAR and 4DVAR
- Verified against NCEP GDAS prepbufr data

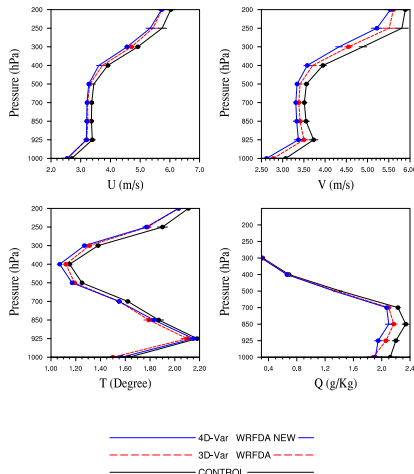

# Averaged RMSE of 24H forecast verification

RMSE Profiles 11 - 26 Sep 2010

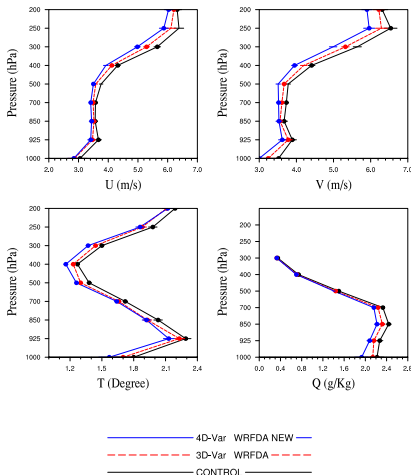

# Averaged RMSE of 36H forecast verification

RMSE Profiles 11 - 26 Sep 2010

# Averaged RMSE of 48H forecast verification

RMSE Profiles 11 - 26 Sep 2010

# Summary

- The single executable WRF 4D-Var system was developed and has showed promising performance.
- The new WRF 4D-Var system has the capability to assimilate conventional observational data (little\_r or prepbufr format), radiance in bufr format and radar data.

# Summary

- The single executable WRF 4D-Var system was developed and has showed promising performance.
- The new WRF 4D-Var system has the capability to assimilate conventional observational data (little\_r or prepbufr format), radiance in bufr format and radar data.
- The new WRF 4D-Var system is able to consider lateral boundary condition as control variable and digital filter can be used as a weak constraint to suppress the high frequency noise.

# Summary

- The single executable WRF 4D-Var system was developed and has showed promising performance.
- The new WRF 4D-Var system has the capability to assimilate conventional observational data (little\_r or prepbufr format), radiance in bufr format and radar data.
- The new WRF 4D-Var system is able to consider lateral boundary condition as control variable and digital filter can be used as a weak constraint to suppress the high frequency noise.
- Multiple outer loops for 4D-Var.

# Summary

- Multiple outer loops for 4D-Var.

## Development after V3.3

- Add simplified physics packages into WRFPLUS: surface drag(**done**), large scale condensation(**done**), a simplified cumulus scheme(**done**), as well as a radiation scheme (GSFC).
- Parallelization of WRF tangent linear codes (**done**)

## Development after V3.3

- Add simplified physics packages into WRFPLUS: surface drag(**done**), large scale condensation(**done**), a simplified cumulus scheme(**done**), as well as a radiation scheme (GSFC).
- Parallelization of WRF tangent linear codes (**done**)
- Parallelization of WRF adjoint codes.

## Development after V3.3

- Add simplified physics packages into WRFPLUS: surface drag(**done**), large scale condensation(**done**), a simplified cumulus scheme(**done**), as well as a radiation scheme (GSFC).
- Parallelization of WRF tangent linear codes (**done**)
- Parallelization of WRF adjoint codes.
- Multi-incremental 4D-Var configuration.

## Development after V3.3

- Add simplified physics packages into WRFPLUS: surface drag(**done**), large scale condensation(**done**), a simplified cumulus scheme(**done**), as well as a radiation scheme (GSFC).
- Parallelization of WRF tangent linear codes (**done**)
- Parallelization of WRF adjoint codes.
- Multi-incremental 4D-Var configuration.
- Add precipitation observation to the forcing term.

## Development after V3.3

- Add simplified physics packages into WRFPLUS: surface drag(**done**), large scale condensation(**done**), a simplified cumulus scheme(**done**), as well as a radiation scheme (GSFC).
- Parallelization of WRF tangent linear codes (**done**)
- Parallelization of WRF adjoint codes.
- Multi-incremental 4D-Var configuration.
- Add precipitation observation to the forcing term.

# Upcoming

A hand-on tutorial for WRF 4D-Var V3.3 will be presented on  
June 24, Friday morning 8:30AM-10:00AM

- Overview
- Installation
- Setup
- Run

# Thank You

The NESL Mission is:

- To advance understanding of weather, climate, atmospheric composition and processes;
- To provide facility support to the wider community; and,
- To apply the results to benefit society.

NCAR is sponsored by the National Science Foundation
